Received June 20, 1990

δ-Tocopherol was reacted with an alkylperoxyl radical at 37°C in benzene. 2,2'-Azobis(2,4-dimethylvaleronitrile) was used to generate the alkylperoxyl radical. The reaction products of δ-tocopherol were isolated and characterized. There were d-tocored, four stereoisomers of 8a-(l-cyano-1,3-dimethyl)butylperoxy-δ-tocopherone, a mixture of four stereoisomers of 8a-(1-cyano-1,3-dimethyl)butylperoxy-5-(δ-tocopheroxy)-δ-tocopherone, 5-(δ-tocopheroxy)-δ-tocopherol, a mixture of four stereoisomers of 8a-(1-cyano-1,3-dimethyl)butylperoxy-5-{[5-(δ-tocopheroxy)]-δ-tocopherone, and 5-{[5-(δ-tocopheroxy)]-δ-tocopheroxy]-δ-tocopherol. From the reaction products of δ-tocopherol and its dimer, a possible mechanism for the reaction of δ-tocopherol with peroxyl radicals was discussed.

Tocopherols are natural antioxidants in foods and are important in promoting the stability of vegetable oils. Tocopherols inhibit autoxidation of oils by trapping peroxyl radicals.1,2 To elucidate the antioxidative mechanisms of tocopherols, the reaction products of tocopherols with peroxyl radicals have been extensively studied.3-9 We have already reported that the reactions of α- and γ-tocopherols with an alkylperoxyl radical generated from the thermal decomposition of a radical initiator, 2,2'-azobis(2,4-dimethylvaleronitrile) (AMVN), give the 8a-alkylperoxy tocopherones and some other compounds.5,7,9 δ-Tocopherol is also present in vegetable oils.10,11 Although the oxidation products of δ-tocopherol during the autoxidation of unsaturated lipids have been reported to be some reducing dimers,12,13 the reaction of δ-tocopherol with lipid-peroxyl radicals has not been satisfactorily elucidated. This paper reports the reaction products of δ-tocopherol with AMVN in benzene.

Materials and Methods

**Materials**. RRR-δ-Tocopherol was prepared from mixed isomers of tocopherol (Hohnen Oil Co.).14 A free radical initiator, AMVN, was purchased from Wako Pure Chem. Ind. δ-Tocopherylquinone was prepared from δ-tocopherol by oxidation with FeCl3.15 A δ-tocopherol dimer, 5-(δ-tocopheroxy)-δ-tocopherol (δ-tocopherol diphenylether dimer: δ-TED), was isolated from the reaction products of δ-tocopherol with p-benzoquinone.16 2,2,5,7,8-Pentamethylchroman-6-ol (PMC) was prepared by the method of Nilsson et al.17 All other chemicals were of analytical grade.

**High performance liquid chromatography (HPLC)**. HPLC was done with a Jasco Trirotor V pump equipped with a Model GP-A40 gradient programmer. A Jasco Model 875-UV detector or a Model 820-FP spectrofluorometer was used as the detector.

**Reaction procedure**. δ-Tocopherol (0.83 mg, 2 mmol) and AMVN (49.6 g, 200 mmol) were dissolved in benzene (1000 ml) and incubated at 37°C for 45 or 90 min under air. After the solvent was removed in vacuo at 37°C for 45 or 90 min under air. After the solvent was removed in vacuo, the oily residue was dissolved in 200 ml of ethanol and left at -20°C for 2 hr. The resulting crystals of AMVN were removed by filtration. The reaction products in the filtrate were isolated by preparative reverse-phase HPLC. A Wakosil SC18 column (10 x 300 mm, Wako Pure Chem. Ind.) was developed with methanol at a flow rate of 5.0 ml/min. The elution of δ-tocopherol was monitored by a flow detector. The products were further purified by preparative normal-phase HPLC. A LiChrosorb Si60 column (4.6 x 250 mm, Merck) was developed with hexane-2-
propanol (98:2, v/v) at a flow rate of 1.5 ml/min. The eluents were monitored by its absorbance at 285 nm. The purities of isolated compounds were checked by thin layer chromatography on pre-coated silica gel 60 plate (Merck) using hexane-diethyl ether (70:30, v/v). The isolated compounds were dissolved in ethanol or hexane and stored at -20°C until analysis.

To observe the course of the reaction, δ-tocopherol (0.73 mM or 22.5 μmol) or δ-TED (1.22 μmol) was reacted with AMVN (100 mM) in benzene at 37°C. At regular intervals, a 0.5-ml-sample was withdrawn and the amounts of δ-tocopherol and its reaction products were measured by reverse-phase HPLC. A μBondasphere 5μC18 100 Å column (3.9 x 150 mm, Nihon Waters Co.) was developed with a methanol or a 15-min linear gradient of methanol to methanol-ethyl acetate (3:7, v/v) at a flow rate of 1.0 ml/min. The amounts of δ-tocopherol were calculated from the peak area by monitoring the fluorescence (ex., 290 nm; em., 330 nm). PMC was used as an internal standard. The amounts of the reaction products were calculated from the peak area by monitoring the elutions at 240 nm or 290 nm. δ-Tocopherylquinone was used as internal standards.

Spectroscopy. Proton (1H) and carbon-13 (13C) nuclear magnetic resonance (NMR) spectra were recorded on a Jeol JNM-GX-270 FT NMR spectrometer. Mass spectra (MS) were obtained with a Shimadzu GCMS 9020 DF gas chromatograph-mass spectrometer system with an ionizing energy of 70 eV. Infrared (IR) spectra of samples were taken on a Jasco A-302 IR spectrometer. Ultraviolet (UV) spectra were measured with a Jasco Ubest-30 spectrophotometer. Specific rotations were measured with a Union PM-201 polarimeter.

Results

δ-Tocopherol and AMVN were reacted at 37°C for 45 or 90 min, and the reaction products were analyzed by reverse-phase HPLC (Fig. 1). Many peaks corresponding to the reaction products appeared on the chromatograms. Peaks 1, 2, 3, 4, 5 and 7 in the 90-min reaction mixture and peaks 6 and 8 in the 45-min reaction mixture could be isolated by preparative reverse-phase HPLC developed with increasing proportions of ethyl acetate in methanol. Peak 3 was further separated into two peaks, 3a and 3b, by normal-phase HPLC. The structures of 1, 2, 3a, 3b, 4, 5, 6, 7 and 8 were identified as described below (Fig. 2).

Compound 1 was obtained as a dark red oil (Rf 0.21, 41.1 mg yield). The structure was identified to be δ-tocored by comparing its spectral data with tocored.9) UV λmax (ethanol) nm (ε): 276.5 (5900); IR νmax (film) cm⁻¹: 1690, 1640, 1590; MS m/z: 416 (M⁻, 69%), 402 (3), 221 (13), 173 (16), 182 (24), 152 (100); 1H NMR δ (CDCl₃): 0.8–0.88 (12H, m), 1.11–1.62 (21H, broad m), 1.33 (3H, s), 1.73 (2H, m), 2.08 (3H, s), 2.43 (2H, m), 6.16 (1H, s); 13C NMR δ (CDCl₃): 15.6, 17.8, 19.6, 19.7, 20.9, 22.6, 22.7, 23.8, 24.4, 24.8, 28.0, 29.0, 32.6, 32.8, 37.3 (2C), 37.4 (2C), 39.4, 39.9, 81.4, 112.2, 126.6, 150.3, 162.2, 177.9, 180.7.

Compounds 2, 3a, 3b and 4 were obtained as colorless oils (2: Rf 0.36, 10.0 mg yield; 3a: Rf 0.45, 10.6 mg yield; 3b: Rf 0.39, 12.8 mg yield; 4: Rf 0.50, 12.0 mg yield). These were shown to be peoxides by the KI test.18) The spectral data showed that the compounds 2, 3a, 3b and 4 were stereoisomers of 8a-(1-cyano-1,3-dimethyl)butylperoxy-δ-tocopherone.5,7,9
Compound 2, 8a(S)-[1(R)-cyano-1,3-dimethyl]butylperoxy-\(\delta\)-tocopherone. Compound 5 was obtained as a yellow oil \((R_f \ 0.64, 75.6 \text{ mg yield})\). This compound was shown to be a peroxide.\(^{18}\) From the spectral data, compound 5 was identified to be a mixture of four stereoisomers of 8a-(1-cyano-1,3-dimethyl)butylperoxy-5-\((5\text{-tocopheroxy})\)-\(\delta\)-tocopherone.\(^9\) UV \(\lambda_{\text{max}}\) (ethanol) nm (\(\epsilon\)): 291 (8850), 231 (shoulder); IR \(\nu_{\text{max}}\) (film) cm\(^{-1}\): 1670; MS \(m/z\): 802 \([\text{M} - 541]^+\), 364, 401, 284, 189, 178; \(^1\)H NMR \(\delta\) (CDCl\(_3\)): 0.83-0.92 (30H, m), 1.18 (3/2H, s), 1.20 (3/2H, s), 1.21 (9/4H, s), 1.22 (3/4H, s), 1.39 (3/4H, s), 1.40 (3/4H, s), 1.59 (3/4H, s), 1.61 (9/4H, s), 1.99 (3/2H, s), 2.07 (3/2H, s), 2.08 (9/4H, s), 2.10 (9/4H, s), 2.11 (3/4H, s), 2.30-2.75 (6H, m), 5.97 (1/2H, s), 5.99 (1/2H, s), 6.38 (1/4H, s), 6.39 (1/2H, s), 6.40 (1/4H, s), 6.47 (1/2H, s), 6.49 (1/4H, s), 6.50 (1/4H, s), 6.63 (3/4H, s), 6.64 (1/4H, s).

Compound 6 was obtained as a colorless oil \((R_f \ 0.70, 77.2 \text{ mg yield})\). The structure was identified to be 3-TED by comparing its spectral data with an authentic sample.\(^{19}\) UV \(\lambda_{\text{max}}\) (ethanol) nm (\(\epsilon\)): 295.5 (8400); IR \(\nu_{\text{max}}\) (film) cm\(^{-1}\): 3550; MS \(m/z\): 802 (M\(^+\), 100%); \(^{13}\)C NMR \(\delta\) (CDCl\(_3\)): 11.6-40.2 (60C), 75.3, 75.8, 75.9, 111.9, 115.1, 115.3 (2C), 121.4, 123.4, 127.7, 137.1, 141.2, 145.7, 147.2, 149.7.

Compound 7 was obtained as a yellow oil \((R_f \ 0.82, 22.5 \text{ mg yield})\). The compound was peroxide.\(^{18}\) The spectral data indicated that compound 7 was a mixture of four stereoisomers of 8a-(1-cyano-1,3-dimethyl)butylperoxy-5-\([\text{[5-\(\delta\)-tocopheroxy]-\(\delta\)-tocopheroxy]}\)-\(\delta\)-tocopherone. UV \(\lambda_{\text{max}}\) (ethanol) nm (\(\epsilon\)): 294.5 (11,500); IR \(\nu_{\text{max}}\) (film) cm\(^{-1}\): 3500; MS \(m/z\): 802 \([\text{M} - 400]^+\), 41%, 402 (60), 271 (55), 177 (44), 153 (45), 137 (100); \(^1\)H NMR \(\delta\) (CDCl\(_3\)): 0.83-0.88 (36H, m), 1.07-1.80 (69H, broad m), 1.20 (3H, s), 1.23 (3H, s), 1.24 (3H, s), 2.04 (3H, s), 2.11 (6H, s), 2.44 (2H, m), 2.65 (4H, m), 4.94 (1H, s), 6.24 (1H, s), 6.41 and 6.42 (1H, s), 6.59 and 6.60 (1H, s), 6.61 (1H, s); \(^{13}\)C NMR \(\delta\) (CDCl\(_3\)): 15.8-40.2 (60C). 75.3, 75.7, 75.8, 111.4, 113.4, 114.9, 115.4, 115.6, 116.8, 121.4, 122.7, 123.5, 127.7, 136.7, 138.8, 141.0, 142.0, 145.4, 146.9, 147.1, 150.8.

Two different concentrations of \(\delta\)-tocopherol were reacted with constant AMVN at 37°C, and the amounts of \(\delta\)-tocopherol and its reaction products were measured by reverse-phase HPLC (Fig. 3). At a low concentration of \(\delta\)-tocopherol, \(\delta\)-TED (6) formed initially, and then \(\delta\)-tocored (1), 8a-alkylperoxy-\(\delta\)-tocopherone (2-4) and 8a-alkylperoxy-\(\delta\)-TED (5) accumulated with the decrease of 3-tocopherol. In addition to these compounds, trimer (8) and 8a-alkylperoxy trimer (7) were formed at a high concentration of \(\delta\)-tocopherol. When \(\delta\)-TED (1.22 mM) was reacted with 100 mM AMVN in benzene, \(\delta\)-
Reaction of $\delta$-Tocopherol with Alkylperoxyl Radical

Fig. 3. Course of the Reaction of $\delta$-Tocopherol with AMVN.

Fig. 4. Course of the Reaction of $\delta$-TED with AMVN.

A reaction mixture containing 1.22 mM $\delta$-TED and 100 mM AMVN in benzene was incubated at 37°C. —■— , $\delta$-TED; —●— , $\delta$-tocopherol, — ○— , $\delta$-tocored; — △— , 8a-alkylperoxy-$\delta$-tocopherone; — □— , 8a-alkylperoxy-$\delta$-TED; — ▼— , trimer; — ▽— , 8a-alkylperoxy trimer.

tocopherol, $\delta$-tocored, 8a-alkylperoxy-$\delta$-tocopherone, 8a-alkylperoxy-$\delta$-TED, trimer and 8a-alkylperoxy trimer were detected (Fig. 4). Although the $\delta$-tocored and 8a-alkylperoxy-$\delta$-TED accumulated with the decrease of $\delta$-TED, the $\delta$-tocopherol and trimer further reacted with another alkylperoxyl radical to produce 8a-alkylperoxy-$\delta$-tocopherone and 8a-alkylperoxy trimer, respectively.

Discussion

The reaction of tocopherols with an alkylperoxyl radical is thought to be a model for the reaction of tocopherols with lipidperoxyl radicals, which occurs in chain-breaking during autoxidation of edible oils. We have already characterized the reaction products of $\alpha$- and $\gamma$-tocopherols with an alkylperoxyl radical generated from AMVN.5,7,9 They are the covalent adducts of the tocopheroxyl radical with the alkylperoxyl radical and some other products. The reaction products of $\delta$-tocopherol with AMVN were similar to those of $\alpha$- and $\gamma$-tocopherols; there were $\delta$-tocored (1), 8a-alkylperoxy-$\delta$-tocopherone (2-4), 8a-alkylperoxy-$\delta$-TED (5), $\delta$-TED (6), 8a-alkylperoxy $\delta$-tocopherol trimer (7), and $\delta$-tocopherol trimer (8) (Fig. 2). The 8a-alkylperoxy compounds were produced by the reactions of alkylperoxyl radicals with $\delta$-tocopherol and its reducing dimer and trimer, respectively. $\delta$-Tocopherol biphenyl dimer ($\delta$-TBD) in addition to $\delta$-TED has been reported to be formed during autoxidations of
methyl linoleate" and triglycerides. However, there was no 5-TBD in the reaction mixture of 5-tocopherol with AMVN.

Scheme 1 shows a possible reaction pathway for the reaction of 5-tocopherol with peroxy radicals. This reaction is started by hydrogen abstraction of the peroxy radical (LOO·) from 5-tocopherol. The resulting tocopheroxyl radical reacts irreversibly with a second peroxy radical or with each other to form a covalent adduct or a dimeric compound, respectively. The bimolecular self-reaction of 5-tocopheroxyl radical in the presence of oxygen has been reported to be $2 \times 10^5 \text{ M}^{-1}\text{sec}^{-1}$ occupied. Therefore, the 5-tocopheroxyl radicals produced can rapidly react with each other to form a dimer. Our results indicated that the 5-tocopheroxyl radicals could react with each other to form the dimer (6) and that the formation ratio of covalent adducts (2-4) was low. Further, the resulting dimer, 5-TED, transferred hydrogen atoms to peroxy radicals to form 5-TED radicals which, in turn, reacted with another peroxy radical or with 5-tocopheroxyl radical to form 8a-alkylperoxy-5-TED (5) and both 5-tocored (1) and 5-tocopherol or a trimer (8), respectively (Fig. 4). Then the trimer could react with two peroxy radicals to give 8a-alkylperoxy trimer (7). From these results, not only 5-tocopherol but also its reducing dimer and trimer may scavenge peroxy radicals during the autoxidation of edible oils.
