Received May 28, 2001; accepted August 3, 2001

Four novel withanolide-type steroids named cilistols p, pm, p1 and u (1—4, respectively), were isolated from the leaves of Solanum cilistum. The respective structures were characterized by spectroscopic means as follows: cilistol p (1) was (22R,24R,25R,26S)-1-oxo-22,26-epoxy-3α,5α-cycloergostane-6β,17α,24,25,26-pentaol 26-O-β-D-glucopyranoside, cilistol pm (2) corresponded to the 6-0-methyl ether derivative of 1; cilistol p1 (3) was represented as the 24-O-methyl ether of 1, and cilistol u (4) was shown to be the epoxide between C-24 and -25, presumably bearing cilistols p, pm and p1 by ring-opening.

Key words Solanum cilistum; Solanaceae; withanolide-type steroid; 3,5-cyclo-steroid; cilistol

In our search for bioactive steroidal glycosides with potent anti-cancer1 and anti-herpes simplex virus type-1 (HSV-1)2 activities among the Solanum-genera plants, we have found the occurrence of withanolide-type steroids, 3—5 which are characteristic constituents, being quite different from the so-far obtained spirostanol, furostanol, spirostane and solanidine glycosides,6) from the leaves of Solanum cilistum. We reported twelve withanolide-type steroids, named cilistols a, b, d, f, g, t, i, j, y and w.3—5) In a continuing study on the steroidal constituent in the leaves, we have isolated four additional novel withanolide-type steroids. Herein, we describe their structural characterization.

The leaves (560 g) of this plant was extracted with hot MeOH repeatedly and was concentrated under reduced pressure to give an extract (68.0 g), which was defatted with hexane. The insoluble layer was chromatographed on Diaion HP-20P by eluting with H2O, 30, 50, 70 and 90% aq. MeOH, successively. The respective fractions were subsequently subjected to a variety of column chromatographies such as silica gel (CHCl₃ : MeOH = 9:1:0.1) and Chromatorex ODS (60% MeOH → 90% MeOH → MeOH), and Sephadex LH-20 (MeOH) to afford four withanolide-type steroidal structures, named cilistols p (1, 14.8 mg), pm (2, 102.8 mg), p1 (3, 35.2 mg) and u (4, 25.5 mg).

Cilistol p (1) was obtained as an amorphous powder, [α]D₀ = 77.8° (MeOH). A quasi-molecular ion peak at m/z 655 [M+H]⁺ in the positive FAB-MS and elemental analysis of 1 indicated its molecular formula to be C₃₄H₅₄O₁₂. At first, signals in the pyridine-d₄ due to two steroidal angular methyl groups (each 3H, s, at δ 0.86, 1.47) at C-18 and -19, respectively, one secondary methyl group (3H, d, J = 6.7 Hz at δ 1.38) at C-21, H-22 (δ 5.10, br d, J = 12.2 Hz), one β-D-glucopyranosyl moiety (H-1, d, J = 7.9 Hz at δ 5.35; H-2, t-like, J = 8.3 Hz at δ 4.00; H-3, t-like, J = 8.3 Hz; H-4, t-like, J = 8.3 Hz at δ 4.25; H-5, m, at δ 3.94; H-6, dd, J = 4.9, 12.2 Hz at δ 4.39; H-6', br d, J = 12.2 Hz at δ 4.49) and H-26 (an acetal proton, s, at δ 5.59) on the 1H-NMR spectrum could be easily assigned by comparing with those co-existing withanolide-type steroids so far obtained.3—5) Furthermore, the 1H-1H shift correlation spectroscopy (COSY), heteronuclear multiple quantum coherence (HMQC), and heteronuclear multiple bond correlation (HMBC, Fig. 1) techniques led to the assignments of the signals due to two methylene-protons (each 1H, t-like, J = 4.9 Hz, at δ 0.08, 0.89) being characteristic in respect to appearance in very high field, two tertiary methyl groups (each 3H, s, at δ 1.79, 2.06) adjacent to the oxygen function, a carbonyl group, and an oxygen-bearing methine-proton (br s, at δ 3.46) to be H-24, H-27, H-28 and H-6. The signals due to a methane group at C-3 (δ 0.17, m, and δ 15.7), a methylene group at C-4 (δ 0.89, 0.89, δ 18.0) and a quaternary carbon at C-5 (δ 52.9) were correlated to each other between H-3 and H-4 in the 1H–1H COSY and between C-5 and H-19 in the HMBC, establishing the presence of a 3,5-cyclo structure. Thus, the plain structure of 1 was represented as shown in Fig. 1. The nuclear Overhauser enhancement spectroscopy (NOESY, Fig. 2) was observed between H-4 (δ 0.89) and H-3 (δ 1.29), H-4 (δ 0.89) and H-6 (δ 3.46), H-4 (δ 0.89, 0.89) and H-19 (δ 1.47). Since the H-6 signal appeared as a broad singlet at δ 3.46, the orientation of the hydroxyl group at C-6 was concluded as β-side, taking into consideration the correlation between the coupling constant and the vicinal angle on the stereo model. Furthermore, concerning the relative configurations at C-22, -24, -25 and -26, based upon the result of the NOESY between H-22 and H-23, H-22 and H-28, respectively, and H-26 and H-27 as illustrated in Fig. 2 and X-ray analysis of cilistol a,1,3) they were concluded to be 22R,24R,25R,26S. Consequently, the structure of 1 was (22R,24R,25R,26S)-1-oxo-22,26-epoxy-3α,5α-cycloergostane-6β,17α,24,25,26-pentaol-26-O-β-D-glucopyranoside.

Cilistol pm (2) was obtained as an amorphous powder with [α]D₀ = -65.2° (MeOH). A quasi-molecular ion peak at m/z 669 [M+H]⁺ in the positive FAB-MS and elemental analysis of 2 indicated its molecular formula to be C₃₅H₅₆O₁₂. By comparing the 1H- and 13C-NMR spectra (in pyridine-d₅) of 2 with those of 1, 2 was shown to be almost identical with 1. Its molecular weight was higher by 14 mass units than that of 1, suggesting 2 to be a methyl derivative of 1. Appearance of the methoxyl signal at δ 3.30 (3H, s) in the 1H-NMR spectrum supported this assumption. The HMBC observation between methyl protons at δ 0.30 and C-6 at δ 81.6 led to the conclusion that the methyl group links to the hydroxyl at C-
6. Consequently, the structure of 2 could be represented as the 6-O-methyl ether of 1.

Cilistol p1 (3) was isolated as an amorphous powder with \([\alpha]_D = -125.0^\circ\) (MeOH). A quasi-molecular ion peak at \(m/z 669\) \([M + H]^+\) in the positive FAB-MS and elemental analysis of 3 indicated its molecular formula to be \(C_{31}H_{56}O_{12}\), which is identical with that of 2. The \(^1H\)-NMR spectrum (in pyridine-\(d_5\)) resembled those of 1 and 2; however, a methoxyl signal newly appeared at \(\delta 3.50\) and the signals due to \(H_3-27\) and \(H_3-28\) shifted toward higher field by 0.13 and 0.17 ppm, respectively, by comparing with those of 1. The \(^13C\)-NMR signal at \(\delta 77.3\) assignable to C-24 was shifted by 1.40 ppm in comparison with that of 1. Accordingly, it was apparent that the methyl group was attached to the hydroxyl group at C-24. The structure of 3 could be represented as the 24-O-methyl ether derivative of 1.

Cilistol u (4) was obtained as an amorphous powder, \([\alpha]_D = -102.0^\circ\) (MeOH). A quasi-molecular ion peak at \(m/z 637\) \([M + H]^+\) in the positive FAB-MS and elemental analysis of 4 indicated its molecular formula to be \(C_{30}H_{52}O_{11}\). The whole pattern of the \(^1H\)-NMR spectrum (in pyridine-\(d_5\)) resembled that of 1; however, the signals due to \(H_1-27\) and \(H_1-28\) shifted toward higher field by 0.13 and 0.17 ppm, respectively. Therefore, 4 was regarded as an epoxy compound at C-24 and -25 corresponding to 1. Consequently, the structure of 4 was \((22R,24S,25R,26S)-1\)-oxo-22,26,24,25-diepoxy-3\(\alpha,5\alpha\)-cycloergostane-6\(\beta,17\alpha,26\)-triol \(26-O-\beta-D\)-glucopyranoside.

The compounds 1—4 with the 3,5-cyclo structure obtained...
at this time were suspected to be produced secondarily from 3-O-sulfate type such as cilistols y and w\textsuperscript{5}) during extraction and separation; however, reinvestigation by extraction using a mixture solvent of acetone and water at room temperature substantiated the occurrence of \textit{1—4}; therefore, they are regarded as genuine constituents.

In so far as \textit{1—4} have the acetal group at C-26 and the 3,5-cyclo-propane ring, they are distinguishable from other withanolides obtained from solanaceous plants.

Taking into account the withanolide type-steroids so far obtained from the title plant, a biogenetic hypothetical scheme would be proposed as shown in Fig. 4.

**Experimental**

**General Procedures** Optical rotations were determined on a JASCO DIP-1000 polarimeter (\(l=0.5\)). FAB-MS were obtained in a glycerol matrix in the positive ion mode using a JEOL JMS-DX300 and JMS-DX303HF. NMR spectra were measured in pyridine-\(d_5\) on a JEOL \(\alpha-500\) spectrometer (500 MHz) and chemical shifts were referenced to tetramethylsilane (TMS). Column chromatography was carried out on silica gel 60 (230—400 mesh, Merck), Sephadex LH-20 (25—100 nm, Pharmacia Fine Chemicals), MCI gel CHP-20P (75—150 \(\mu\)m, Mitsubishi Kasei), Chromatorex ODS (30—50 \(\mu\)m, Fuji Sylsia Chemical Ltd.), and TLC was performed on precoated silica gel 60F\textsubscript{254} (0.2 mm, Merck).

**Plant Material** Seeds of the title plant were provided by Dr. Masaharu Matsui (National Research Institute of Vegetables, Ornamental Plants and Tea, Ministry of Agriculture, Forestry and Fisheries, Ano, Mie, Japan) and cultivated at the Botanical Garden of Kumamoto University.
Extraction and Isolation  The leaves (560 g) of this plant was extracted with hot MeOH repeatedly and evaporated under reduced pressure to give an extract (68.0 g), which was defatted with hexane. The insoluble layer was chromatographed on Diaion HP-20P by eluting with H_2O, 30, 50, 70 and 90% MeOH, successively. The respective fractions were subjected to a variety of column chromatographies such as silica gel (CHCl_3:MeOH=20:1) and Sephadex LH-20 (MeOH) to afford four withanolide-type steroids, named cilistols p (1, 14.8 mg), pm (2, 102.8 mg), pl (3, 35.2 mg) and u (4, 25.5 mg).

Cilistol p (1): Amorphous powder, [α]_D^23 -77.8° (c=0.23, MeOH). Pos. FAB-MS (m/z): 655 [M+H]^+. 1H-NMR (pyridine-d_5): δ: 0.07 (1H, t-like, J=4.9 Hz, H-4), 0.86 (3H, s, H-18), 0.89 (1H, t-like, J=4.9 Hz, H'-4), 1.27 (1H, m, H-3), 1.38 (3H, d, J=6.7 Hz, H-21), 1.47 (3H, s, H-19), 1.79 (3H, s, H-27), 2.06 (3H, s, H-28), 2.10 (1H, d, J=18.0 Hz, H-2), 2.34 (1H, t-like, J=12.8 Hz, H-23), 2.47 (1H, m, H-20), 2.67 (1H, t-like, J=12.8 Hz, H'-23), 2.84 (1H, dd, J=4.0, 18.0 Hz, H'-2), 3.46 (1H, br s, H-6), 3.99 (1H, m, glc H-5), 4.00 (1H, t-like, J=8.3 Hz, glc H-2), 4.22 (1H, t-like, J=8.3 Hz, glc H-3), 4.25 (1H, t-like, J=8.3 Hz, glc H-4), 4.39 (1H, dd, J=4.9, 12.0 Hz, glc H-6), 4.49 (1H, br d, J=12.0 Hz, glc H'-6), 5.10 (1H, br d, J=12.2 Hz, H-22), 5.36 (1H, d, J=8.3 Hz, glc H-1), 5.59 (1H, s, H-26). 13C-NMR: see Table 1. Anal. Calcd for C_{35}H_{54}O_{12}: C, 62.85; H, 8.31. Found: C, 62.23; H, 8.33.

Cilistol pm (2): Amorphous powder, [α]_D^23 -65.2° (c=0.36, MeOH). Pos. FAB-MS (m/z): 669 [M+H]^+. 1H-NMR (pyridine-d_5): δ: 0.10 (1H, t-like, J=6.1 Hz, H-4), 0.82 (3H, s, H-18), 0.89 (1H, t-like, J=4.9 Hz, H'-4), 1.12 (1H, m, H-3), 1.29 (3H, s, H-19), 1.37 (3H, d, J=7.3 Hz, H-21), 1.79 (3H, s, H-27), 2.04 (1H, d, J=17.1 Hz, H-2), 2.07 (3H, s, H-28), 2.35 (1H, t-like, J=12.8 Hz, H-23), 2.70 (1H, brs, H-6), 2.82 (1H, dd, J=3.7, 17.1 Hz, H'-2), 3.30 (3H, s, OMe-6), 3.95 (1H, m, glc H-5), 4.01 (1H, t-like, J=8.6 Hz, glc H-2), 4.23 (1H, t-like, J=8.6 Hz, glc H-3), 4.26 (1H, t-like, J=8.6 Hz, glc H-4), 4.41 (1H, dd, J=4.9, 12.2 Hz, glc H-6), 4.50 (1H, br d, J=12.2 Hz, glc H'-6), 5.11 (1H, br d, J=12.2 Hz, H-22), 5.36 (1H, d, J=8.6 Hz, glc H-1), 5.60 (1H, s, H-26). 13C-NMR: see Table 1. Anal. Calcd for C_{35}H_{56}O_{12}: C, 62.85; H, 8.44. Found: C, 62.73; H, 8.36.

Cilistol pl (3): Amorphous powder, [α]_D^23 -125.0° (c=0.26, MeOH). Pos. FAB-MS (m/z): 669 [M+H]^+. 1H-NMR (pyridine-d_5): δ: 0.08 (1H, t-like, J=4.1 Hz, H-4), 0.86 (3H, s, H-18), 0.89 (1H, t-like, J=4.1 Hz, H'-4), 1.27 (1H, m, H-3), 1.36 (3H, d, J=6.7 Hz, H-21), 1.47 (3H, s, H-19), 1.64 (3H, s, H-27), 1.89 (3H, s, H-28), 2.04 (1H, t-like, J=13.3 Hz, H-23), 2.10 (1H, d, J=17.7 Hz, H-24), 2.46 (1H, m, H-20), 2.60 (1H, t-like, J=13.3 Hz, H'-23), 2.82 (1H, dd, J=4.0, 17.7 Hz, H'-2), 3.46 (1H, br s, H-6), 3.50 (1H, s, OMe-24), 3.92 (1H, m, glc H-5), 3.98 (1H, t-like, J=8.5 Hz, glc H-2), 4.20 (1H, t-like, J=8.5 Hz, glc H-3), 4.23 (1H, t-like, J=8.5 Hz, glc H-4), 4.37 (1H, dd, J=4.9, 11.6 Hz, glc H-6), 4.48 (1H, brd, J=11.6 Hz, glc H'-6), 5.03 (1H, brd, J=12.2 Hz, H-22), 5.30 (1H, d, J=7.9 Hz, glc H-1), 5.46 (1H, s, H-26). 13C-NMR: see Table 1. Anal. Calcd for C_{35}H_{54}O_{12}: C, 62.85; H, 8.44. Found: C, 62.97; H, 8.51.

Acknowledgements  We are grateful to Dr. Masaharu Matsui, National Research Institute of Vegetables, Ornamental Plants and Tea, Ministry of Agriculture, Forestry and Fisheries, Aomori, Aomori, Japan, for supplying the seeds of the title plant, and Mr. Koushi Kitaioka and Mr. Noboru Ogata, for cultivating the plants at the botanical garden of the Faculty of Pharmaceutical Sciences, Kumamoto University.
