FTY720 is employed for the treatment of multiple sclerosis and exerts apoptotic effects on various cancers through protein phosphatase 2A (PP2A) activation. In compound 4, the dihydroxy head group of FTY720 was modified into dihydroxy phenyl group. The cell survival in compound 4 treated colorectal and gastric cancer cells was significantly reduced as compared with control, 34.6 and 25.1%, respectively. The docking study of compound 4 showed that the aromatic head group effectively binds to PP2A.

Key words  FTY720; fingolimod; anticancer; sphingosine kinase; derivative

FTY720 (also known as fingolimod, I) is a synthetic compound, which is modified from myriocin (ISP-1), and it is an immunosuppressant that is effective against multiple sclerosis; its use has been approved by the Food and Drug Administration (FDA). FTY720 is structurally similar to natural lipid, sphingosine, and is phosphorylated in vivo to form FTY720-phosphate. This drug has an inhibitory action on various cancers such as breast cancer and leukemia.1–3 These anticancer activities are related to the activity of protein phosphatase 2A (PP2A) regardless of phosphorylation.4 In addition, FTY720 stimulates beta cell regeneration in mice to normalize hyperglycemia and produce insulin.5,6 Based on various medicinal effects of FTY720, the research has been ongoing until date. Continuous efforts are being put forward by researchers to design FTY720 derivatives (selective for certain diseases) with improved biological effects of FTY720.

FTY720 consists of a structurally polar head group, an aromatic backbone, and an aliphatic chain with 8 carbons. (Fig. 1) The derivatives known so far have been synthesized by modifying each of these three parts of FTY720. Recently, derivatives of FTY720 with modified aromatic part have been reported to be effective in the treatment of multiple sclerosis.7 However, most of the derivatives retain the structure of the aromatic backbone. FTY720-OMe (ROME) is a derivative of FTY720 with selective introduction of one methoxy group into the head group (Fig. 1). ROME selectively inhibits sphingosine kinase (SK)2 and suppresses breast cancer cells.8 Various compounds in the form of FTY720 inhibit SK. SK has two isoforms, SK1 and SK2, which are present in different compartments in the cell. SK inhibitors inhibit the production of sphingosine-1-phosphate (SIP) and thus exhibit anticancer activity.9 SK1 and SK2 play different roles in vivo, therefore, selective inhibitors are required for drug development.9 However, the enantioselective introduction of functional groups into the head of FTY720, such as ROME or FTY720 (S)-phosphate, requires a complicated pathway and many synthetic steps. We have recently reported FTY720 derivatives and their chemical structure to contain serine structure similar to the sphingolipid head group.10 In contrast, like SH-RF-177 or RB-042, synthesis of the derivatives by introducing the chiral head group, such as commercially available azacyclic structure or pyrrolidinol, is easy and biologically effective. SH-RF-177 exhibits anti-leukemic activity both in vitro and in vivo without affecting the SIP receptor, and RB-042 effectively inhibits sphingosine kinase 1 and 2.11–13 ST-968 is an oxazolo-oxazolide derivative (butterfly analog) of FTY720 (Fig. 1) with three-dimensionally fixed head group and effectively binds to SIP1 as compared to FTY720.14 Substitution of functional group in the aromatic structure is useful for finding the binding position of the target because they are fixed compared to the substitution in aliphatic or cyclic forms, which is flexible. Derivatives with the aromatic group in head group, such as compound 3g or RB-050 (Fig. 1), have not been developed much. Compound 3g has an antituberculosis effect, and RB-050 weakly inhibits SK1 and 2.15 These derivatives are very easy to synthesize thus making it easy to figure out the
structure–activity relationship of various functional groups substituted in the aromatic group.

For this reason, we have investigated the anticancer activity of FTY720 derivatives containing the aromatic head groups with various functional groups. Derivatives were synthesized using 1-ethyl-(3-3-dimethylamino propyl)carbodiimide hydrochloride (EDCI) along with 4-n-octylaniline as starting material and compounds 2–10 was obtained by introducing the aromatic head group, such as benzoic acid and nicotinic acid (Chart 1). To investigate the anti-tumor activity of the synthesized FTY720 analogs, the degree of cell death was examined in HT29 cells (human colorectal adenocarcinoma cell) and AGS cells (human gastric adenocarcinoma cell). Statistically significant cell death was observed only in compound 4 (about 34.6 and 25.1%) compared to the control, and no statistically significant cell death was observed with other analogs (Figs. 2a, b). We used annexin-V staining to determine whether the cell death induced by the compound 4 is the result of increased apoptosis. The number of apoptotic cells was significantly increased in HT29 cells treated with compound 4 for 24 h (Fig. 2c). Among the compounds 2–5 in which dihydroxyphenyl was introduced, only the compound 4 was found to be active, therefore it is apparent that the position of hydroxyl group seems to play an important role in exerting anticancer activity. In the case of ROME, an FTY720 derivative, there are immense activity changes even the small structural differences in the FTY720 head group.

FTY720 and compound 4 treatment increased PP2A activity at 8h after treatment in HT29 cells. These results suggest that compound 4 activates PP2A similarly to FTY720 (Fig. 3). We also performed a docking study (PDB code 2E50) to determine whether the aromatic head group of the derivative effectively binds to PP2A (Fig. 4). Similar to the interaction of a hydroxy group of FTY720 with Glu206 and Lys209, the phenol group of compound 4 showed the same interaction. In addition, the amide C=O group in compound 4 interacts with Lys209. The aliphatic terminal chain of compound 4 interacts with Phe68, as like FTY720. However, none of the functional groups of compound 4 exhibited binding with Asp210 bound to the amine of FTY720. These results suggest that reducing the binding affinity causes low anticancer activity. In conclusion, our results demonstrate the importance of the substituted hydroxy group position in the aromatic head group and the necessity of introducing functional groups to replace the amine group of FTY720 for the design of new derivatives. We intend to further investigate the synthesis of additional derivatives employing this result, the inhibitory effect derivatives on sphingosine kinase, and the various biological activities such as the antituberculosis effect.

**Experimental**

**General Experimental Procedures** All chemicals were reagent grade and used as purchased. Flash column chromatography was performed on silica gel grade 60 (230–400 mesh). 1H- and 13C-NMR spectra were recorded on a Bruker Avance I spectrometer, and chemical shifts are reported in δ.
units relative to deuterated solvents, which served as internal references, at 400 and 100 MHz, respectively. High resolution (HR) MS were recorded on an Agilent Technologies 6520A Q-TOF mass spectrometer using electrospray ionization (ESI).

**General Procedure for Synthesis of FTY720 Derivatives 2–10**

EDCI (3 eq), N,N-dimethyl-4-aminopyridine (DMAP) (0.5 eq), and the acid intermediates (1.5 eq) were added to a stirred solution of 4-n-octylaniline (100 mg, 0.49 mmol) in CHCl₃ (5 mL). The reaction mixture was stirred under nitrogen for 12 h. The solvent was removed in vacuo and the resulting residue was purified by flash column chromatography to afford the desired products 2–10.

4-Hydroxy-N-(4-octylphenyl)benzamide 2

1H-NMR (400 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 7.64 (d, J=8.0 Hz, 2H), 7.39 (d, J=8.4 Hz, 2H), 7.04 (t, J=8.6 Hz, 2H), 6.75 (d, J=8.0 Hz, 2H), 2.44 (t, J=8.0 Hz, 2H), 1.44 (q, J=7.2 Hz, 2H), 1.25–1.02 (m, 10H), 0.72 (t, J=6.0 Hz, 3H); 13C-NMR (100 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 167.1, 160.7, 139.4, 136.0, 129.5, 129.0, 121.0, 115.5, 35.6, 32.1, 31.8, 29.9, 29.7, 29.5, 29.2, 22.9, 14.2; ESI-HR-MS (M+H)+ m/z Calcd for C₂₁H₂₈NO₂ 326.2120. Found 326.2120.

2.4-Dihydroxy-N-(4-octylphenyl)benzamide 5

Yellow oil; 1H-NMR (400 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 7.45 (d, J=8.3 Hz, 2H), 7.14 (d, J=8.2 Hz, 2H), 6.73 (dd, J=8.7, 2.3 Hz, 1H), 6.41 (dd, J=8.8, 2.4 Hz, 1H), 3.67 (d, J=2.3 Hz, 1H), 2.54 (t, J=8.0 Hz, 2H), 1.59–1.49 (m, 2H), 1.23 (d, J=13.8 Hz, 10H), 0.82 (t, J=6.4 Hz, 3H); 13C-NMR (100 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 168.3, 165.0, 154.5, 140.2, 134.6, 132.4, 129.0, 121.6, 113.0, 111.4, 103.0, 35.5, 32.0, 31.6, 29.6, 29.3, 22.7, 14.2; ESI-HR-MS (M+H)+ m/z Calcd for C₂₃H₂₉NO₂ 326.2120. Found 326.2128.

N-(4-Octyloxy)isonicotinamide 6

Brown oil; 1H-NMR (400 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 8.49 (d, J=5.8 Hz, 2H), 7.68 (d, J=6.1 Hz, 2H), 7.37 (d, J=8.4 Hz, 2H), 6.96 (d, J=8.4 Hz, 2H), 2.37 (t, J=7.6 Hz, 2H), 1.45–1.32 (m, 2H), 1.17–0.96 (m, 10H), 0.64 (t, J=6.8 Hz, 3H); 13C-NMR (100 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 160.5, 139.1, 135.3, 135.2, 134.8, 128.7, 120.7, 120.0, 119.9, 35.2, 31.7, 31.4, 29.3, 29.1, 22.5, 13.8; ESI-HR-MS (M+H)+ m/z Calcd for C₂₃H₂₉NO₂ 321.2123. Found 321.2155.

4-Bromo-N-(4-octylphenyl)benzamide 7

Brown oil; 1H-NMR (400 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 7.44 (d, J=8.5 Hz, 2H), 7.25 (d, J=8.4 Hz, 3H), 7.18 (d, J=8.2 Hz, 2H), 6.80 (d, J=8.2 Hz, 2H), 2.22 (t, J=7.6 Hz, 2H), 1.28–1.18 (m, 2H), 0.99–0.84 (m, 10H), 0.50 (t, J=6.4 Hz, 3H); 13C-NMR (100 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 139.1, 135.3, 135.2, 131.2, 128.8, 125.8, 120.8, 34.9, 31.4, 31.1, 29.0, 28.8, 28.7, 22.1, 13.2; ESI-HR-MS (M+H)+ m/z Calcd for C₂₃H₂₉BrNO 388.1276. Found 388.1219.

N-(4-Octyloxy)-1H-imidazole-5-carboxamide 8

Yellow oil; 1H-NMR (400 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 7.61 (s, 1H), 7.59 (s, 1H), 7.41 (d, J=8.4 Hz, 2H), 6.99 (d, J=8.4 Hz, 2H), 2.41 (t, J=7.6 Hz, 2H), 1.48–1.36 (m, 2H), 1.21–1.02 (m, 10H), 0.70 (t, J=6.9 Hz, 3H); 13C-NMR (100 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 160.5, 139.1, 135.3, 135.2, 134.8, 128.7, 120.7, 120.0, 119.9, 35.2, 31.7, 31.4, 29.3, 29.1, 22.5, 13.8; ESI-HR-MS (M+H)+ m/z Calcd for C₁₆H₁₉NO₂ 300.2076. Found 300.2037.

2-(4-Hydroxyphenyl)-N-(4-octylphenyl)acetamide 9

Yellow oil; 1H-NMR (400 MHz, CDCl₃–CD3OD=3:1 (v/v)) δ: 7.50 (d, J=7.6 Hz, 2H), 7.27 (d, J=8.3 Hz, 2H), 7.20 (d, J=8.3 Hz, 2H), 6.92 (d, J=8.3 Hz, 2H), 2.65 (t, J=7.7 Hz,

Cell Culture and Proliferation Assays HT29 and AGS cells were maintained in Dulbecco’s modified Eagle’s medium (DMEM) supplemented with 10% fetal bovine serum (FBS), 100 U/mL penicillin and 100 µg/mL streptomycin at 37°C in a humidified 5% CO2–95% air atmosphere. Cells were seeded in 96-well plates at a density of 3×104 cells/well and incubated with annexin-V fluorescein isothiocyanate (FITC) apoptosis detection kit, according to the manufacturer’s instructions. Briefly, the cells were resuspended in binding buffer and then incubated with annexin-V-FITC and propidium iodide at room temperature. After incubation, stained cells were analyzed by Image Based Cell Analyzer.

Annexin-V Staining Apoptosis was measured using an annexin-V fluoroscence isothiocyanate (FTTC) apoptosis detection kit, according to the manufacturer’s instructions. Briefly, cell lysate was incubated with anti-PP2A and Protein

A agarose at 4°C and then had phosphopeptide added. After incubation, samples were analyzed by Thermo Scientific Multiskan GO.
