data. The infrared spectra were determined by Mr. K. Machida and Mrs. I. Hamanaka of Kyoto University, to whom the authors are also grateful.

Summary

Amides of $\beta$-mercaptohydrocinnamic acid were prepared by the addition of hydrogen sulfide to amides of cinnamic acid. Amides of thiosalicylic acid were also prepared. Some of these mercapto-amides formed stable chelates with copper and nickel. Cobalt chelate was not stable enough to be separated in pure state. The ratio of the ligand to the metal was 1:1 in copper chelate and 2:1 in nickel chelate. It was found that these chelate compounds were S-O chelating compounds from the infrared spectra.

(Received April 17, 1961)

91. Masuo Akagi, Setsuzo Tejima, and Masanobu Haga: Biochemical Studies on Thiosugars. III.*1 Synthesis of 6-Deoxy-6-mercapto-$d$-glucose.

(Faculty of Pharmaceutical Sciences, School of Medicine, Hokkaido University*2)

Thiosugars in which the primary hydroxyl group of sugars is substituted by the thiol group are not found in nature, however, it seems to be sure that they have some biological activities on the basis of the rationale of structural analogue. From this point of view, the present work deals with the synthesis and characterization of 6-deoxy-6-mercapto-$d$-glucose (I).

Previously in 1935, Ohle and Mertens1) reported that 6-deoxy-6-mercapto-$d$-glucose (I) was obtained as syrup by the addition of hydrogen sulfide to 1,2-$O$-isopropylidene-5,6-anhydro-$\alpha$-$d$-glucofuranose (II) in barium hydroxide solution and acid-hydrolysis of isopropylidene group of 1,2-$O$-isopropylidene-6-mercapto-$\alpha$-$d$-glucofuranose (III).

In addition, they described that (I) did not react with carbonyl reagents, such as phenylhydrazine, and that $\beta$-pentaacetate of (I) did not form corresponding glycosyl halide derivative.

1) H. Ohle, W. Mertens: Ber., 68, 2176 (1935).
Recently, Pacsu, et al.\textsuperscript{2} described the Bunt's salt derivatives of carbohydrate, that is, 6-deoxy-6-sodium thiosulfato-1,2,3,4-tetra-O-acetyl-\(\beta\)-d-glucopyranose (IV), prepared from sodium thiosulfate and 6-deoxy-6-iodo-1,2,3,4-tetra-O-acetyl-\(\beta\)-d-glucopyranose (V). They hydrolyzed (IV) by 90\% acetic acid after reacetylation obtained di-(6-deoxy-1,2,3,4-tetra-O-acetyl-\(\alpha\)-d-glucopyranose)-6,6'-disulfide (VI) instead of expected 6-deoxy-6-mercapto-6-S-acetyl-1,2,3,4-tetra-O-acetyl-\(\beta\)-d-glucopyranose (VIII), and they did not mention about (I).

In the present work, the introduction of the thiol group into the carbohydrate residues was achieved by two methods; 1) the thiolacetyl compounds were obtained by refluxing corresponding \(p\)-toluenesulfonyl (tosyl) derivatives with potassium thiolacetate in acetone or ethanol according to the procedure devised by Chapman and Owen,\textsuperscript{3} and 2) also corresponding ethylxanthate and thiouronium derivatives were prepared from 6-iodo derivatives.

At the outset, as a convenient intermediate, 6-O-tosyl-1,2,3,4-tetra-O-acetyl-\(\beta\)-d-glucopyranose (VII), which was prepared by the selective tosylation of glucose according to the method of Hardegger and Montavon,\textsuperscript{4} was chosen. By refluxing of (VII) with potassium thiolacetate in acetone solution, 6-deoxy-6-mercapto-6-S-acetyl-1,2,3,4-tetra-O-acetyl-\(\beta\)-d-glucopyranose (VIII), m.p. 130\textdegree-131\textdegree, which was reported by Ohle and Mertens\textsuperscript{1} of m.p. 123\textdegree, was obtained in good yield.

For the preparation of thiols, halogen derivative is more generally adopted than tosyl derivative, the tosyl derivative (VII) was converted to 1-deoxy-6-iodo-1,2,3,4-tetra-O-acetyl-\(\beta\)-d-glucopyranose (V)\textsuperscript{4} by heating in acetic anhydride with sodium iodide. Similarly, (VIII) was obtained in excellent yield from (V) and potassium thiolacetate in acetone.

\begin{center}
\begin{tikzpicture}
\node at (0,0) {\textbf{Chart 2.}};
\end{tikzpicture}
\end{center}

Besides, corresponding ethylxanthate (IX) and thiouronium (X) derivatives were prepared by heating of (V) with potassium ethylxanthate and thiourea respectively.

From (VIII), (IX), (X), and (I) was obtained as hygroscopic syrup by hydrolysis with sodium methoxide and removal of sodium with ion exchange resin.

(I) gave color reaction with sodium nitroferricyanide as thiol and reduced Fehling's solution. Contrary to the descriptions of Ohle and Mertens,\(^1\) (I) reacted with phenylhydrazine as usual and gave phenylosazone of (I), moreover, (VIII) reacted with hydrogen bromide in acetic acid and gave 6-deoxy-6-mercapto-6-S-acetyl-2,3,4-tri-O-acetyl-\(\alpha\)-d-glucopyranosyl bromide, which will be published in the near future. From these discrepancies the incomplete hydrolysis of isopropylidene group of (III) is indicated.

Likewise, as for \(\alpha\)-derivatives, 6-deoxy-6-mercapto-6-S-acetyl-1,2,3,4-tetra-O-acetyl-\(\alpha\)-d-glucopyranose (VIIIa), m.p. 103â€“104\(^\circ\), and corresponding ethylxanthate (IXa) and thiouronium (Xa) derivatives were prepared from 6-deoxy-6-iodo-1,2,3,4-tetra-O-acetyl-\(\alpha\)-d-glucopyranose (Va)\(^4\) in the same manner as \(\beta\)-anomers. These derivatives, (VIII, VIIIa, IX, IXa, X, and Xa), were easily desulfurized by Raney nickel to anomeric 6-deoxy-1,2,3,4-tetra-O-acetyl-\(\beta\)-glucopyranoses (XI and Xla) respectively.

For another tosyl derivative of glucose, 1,2-O-isopropylidene-3,5-benzylidene-6-O-tosyl-\(\alpha\)-d-glucofuranose\(^5\) (XII) was converted to 6-deoxy-6-mercapto-6-S-acetyl-1,2-O-isopropylidene-3,5-benzylidene-\(\alpha\)-d-glucofuranose (XIII) by refluxing with potassium thiolacetate in acetone as stated above. By treatment with dimethylsulfate and sodium hydroxide, (XIII) was easily deacetylated and methylated, and gave 6-deoxy-6-mercapto-1,2-O-isopropylidene-3,5-benzylidene-\(\alpha\)-d-glucofuranose (XIV). By deacetylation with sodium methoxide, (XIII) gave 6-deoxy-6-mercapto-1,2-O-isopropylidene-3,5-benzylidene-\(\alpha\)-d-glucofuranose (XV), which was methylated with diazomethane in ethereal solution to (XIV).

(XV) is comparatively stable and quantitatively oxidized to corresponding disulfide (XVI) by iodine. Also these derivatives (XIII, XIV, XV, and XVI) were desulfurized by Raney nickel and gave known 6-deoxy-1,2-O-isopropylidene-3,5-benzylidene-\(\alpha\)-d-glucofuranose (XVII).\(^6\)

Experimental

6-Deoxy-6-mercapto-6-S-acetyl-1,2,3,4-tetra-O-acetyl-β-D-glucopyranose (VIII)—A solution of 6.0 g. of 6-O-tosyl-1,2,3,4-tetra-O-acetyl-β-D-glucopyranose (m.p. 202–204°) (VII) and 2.0 g. of potassium thiolacetate (1.5 mol. equiv.) in 50 cc. of dehyd. Me2CO was heated under reflux for 6 hr.

After removal of the precipitated potassium tosylate by filtration and washing with Me2CO, the filtrate was concentrated in a slightly reduced pressure. The residual syrup was stirred with H2O, several minutes later, the product solidified and washed with H2O, and dried. Yield, 4.3 g. (90%). After recrystallization from EtOH, (VIII) was obtained as colorless crystals, m.p. 130–131°; [α]D-19 (c=1.0, CHCl3). Anal. Calcd. for C16H22O10S: C, 47.29; H, 5.46; S, 7.88. Found: C, 47.72; H, 5.69; S, 7.74. IR νmax cm⁻¹: 1760 (acetyl CO), 1694 (S-acetyl CO).

(VIII) from 6-Deoxy-6-iodo-1,2,3,4-tetra-O-acetyl-β-D-glucopyranose (V)—A solution of 5.0 g. of (V), m.p. 148° and 1.8 g. of potassium thiolacetate dissolved in 30 cc. of dehyd. EtOH was refluxed for 30 min. After treatment as stated above, (VIII) was obtained in 95% yield.

6-Deoxy-6-ethoxythiocarbonylthio-1,2,3,4-tetra-O-acetyl-β-D-glucopyranose (IX)—5.0 g. of (V), and 2.6 g. of potassium ethylxanthate were refluxed in 30 cc. of Me2CO for 30 min. After cool, the mixture was poured into 200 cc. of H2O. The precipitate was recrystallized from EtOH to 4.2 g. of crystals, m.p. 121–123°; [α]D+23.2 (c=1.1, CHCl3). Anal. Calcd. for C17H21O10S2: C, 45.12; H, 5.35; S, 14.15. Found: C, 44.98; H, 5.60; S, 13.79.

6-Deoxy-6-mercapto-D-glucose (I)—A solution of (VIII) or (IX) (1 mole) in MeOH was treated with MeONa (1 mole) at 0° and the resulting mixture was left to stand overnight in a refrigerator. The precipitates were collected and washed with cold EtOH, which corresponded with sodium salt of (I). The solution of sodium salt in H2O passed through a column of Amberlite IR-120 (H+). The effluent was treated with charcoal and concentrated in a reduced pressure at 40° to colorless syrup, [α]D-49.1 (c=0.8, H2O). This syrup reduced Fehling’s solution and gave color reaction as thiols, and also was obtained from thiouronium iodide (X) by treatment with 2 mole equiv. of MeONa as described above. Anal. Calcd. for C6H12O5S: C, 36.57; H, 5.01; S, 15.19. Found: C, 36.22; H, 5.24; S, 14.87.

Phenylosazone of (I)—A solution of 0.5 g. of (I), 1.0 g. of freshly distilled phenylhydrazine and 1 cc. of 50% AcOH in 15 cc. of H2O was heated on a steam bath for 30 min. After cool, yellow precipitates were filtered off and washed with small amount of cold H2O. Recrystallization from EtOH gave light yellow needles, m.p. 141–143° (dec.). [α]D+42.4 (c=1.4, pyridine). Anal. Calcd. for C18H22O3N4S: C, 57.76; H, 5.87; N, 14.02; S, 8.56. Found: C, 58.00; H, 5.61; N, 14.45; S, 8.55.

Desulfurization of (VIII) by Raney Ni—A solution of 5.0 g. of (VIII) in 50 cc. of dehyd. EtOH was treated with Raney-Ni freshly prepared from 70 g. of Ni-Al alloy in EtOH and then refluxed for 3 hr. After cool, the supernatant solution was decanted and the Ni was washed three times with 50 cc. portions of EtOH. The combined decantates, after treatment with charcoal, were concentrated in a reduced pressure to colorless syrup, which crystallized by trituration with Et2O and petr. ether. Recrystallization from Et2O and petr. ether gave 6-deoxy-1,2,3,4-tetra-O-acetyl-β-D-glucopyranose (XI), m.p. 150–151° (literature m.p. 151°), in 70% yield. [α]D+20 (c=1.0, CHCl3). Anal. Calcd. for C14H20O9: C, 50.60; H, 6.07. Found: C, 50.54; H, 6.21. From (VIIIa), 6-deoxy-tetra-O-acetyl-β-D-glucopyranose (XIa), m.p. 115–117° (literature m.p. 117°), in 70% yield, was obtained in the same manner as (XI). From (IX) or (X) and (IXa) or (Xa), (XI) and (XIa) were also obtained in 60–70% yield respectively.

6-Deoxy-6-mercapto-6-S-acetyl-1,2-O-isopropylidene-3,5-benzylidene-α-D-glucofuranose (XIII)—A mixture of 5.0 g. of 6-O-tosyl-1,2-O-isopropylidene-3,5-benzylidene-α-D-glucofuranose (III), m.p. 118°, and 2.0 g. of potassium thiolacetate was heated under reflux in Me2CO for 3 hr. After treatment as described in (VIII), (XIII) was obtained as white crystals in 90% yield, m.p. 133–134°; [α]D+27.6 (c=1.6, CHCl3). Anal. Calcd. for C18H22O5S: C, 59.01; H, 6.05; S, 8.74. Found: C, 58.97; H, 6.14; S, 8.59.
6-Deoxy-6-mercapto-1,2-O-isopropylidene-3,5-benzylidene-α-D-glucofuranose (XV)—A solution of 3.6 g. of (XIII) in 20 cc. of MeOH containing 0.23 g. of Na (1 mol. equiv) was left to stand at room temperature for 6 hr. Then the mixture was neutralized with AcOH and 3.2 g. of colorless crystals were obtained. Recrystallization from EtOH gave (XV), m.p. 129°; [α]D +16.8 (c=1.0, CHCl3). (XV) gave color reaction with sodium nitroferricyanide and was not hygroscopic. Anal. Calcd. for C16H20O5S: C, 59.25; H, 6.22; S, 9.87. Found: C, 59.04; H, 6.39; S, 9.90.

6-Deoxy-6-mercapto-6-S-methyl-1,2-O-isopropylidene-3,5-benzylidene-α-D-glucofuranose (XIV)—To a solution of 2.5 g. of (XIII) in 25 cc. of Me2CO, 8 cc. of Me2SO4 and 18 cc. of 30% NaOH were added alternately at 50° with stirring for 1.5 hr. After heating at 70° for 15 min., the mixture was poured into 200 cc. of H2O and neutralized with 50% AcOH. The precipitates were recrystallized to colorless crystals from EtOH, m.p. 124°-126°; [α]D +6 (c=1.5, CHCl3). (XIV) was also obtained from (XV) with CH2N2 in Et2O in the usual manner. Anal. Calcd. for C17H22O5S: C, 60.34; H, 6.55; S, 9.46. Found: C, 60.60; H, 6.72; S, 9.29.

Oxidation of (XV) by iodine to disulfide (XVI)—To a solution of 1.0 g. of (XV) or (XIII) in 20 cc. of 0.5N NaOH-EtOH the calculated amount of I2 dissoled in EtOH was added. After 2 hr., the precipitates were filtered off and washed with H2O and EtOH. Recrystallization from CHCl3-EtOH gave white crystalline powder, m.p. 223°; [α]D +3 (c=1.3, CHCl3). Anal. Calcd. for C32H38O10S2: C, 59.12; H, 5.88; S, 9.62. Found: C, 59.26; H, 6.00; S, 9.54.

Desulfurization of (XIII) and (XIV) by Raney-Ni—From (XIII) or (XIV) 6-deoxy-1,2-isopropylidene-3,5-benzylidene-α-D-glucofuranose (XVII), m.p. 111°,6 was obtained in 60°-70% yield in the same manner as described for (VII).

Summary

6-Deoxy-6-thio-D-glucose was prepared by hydrolysis of 6-deoxy-6-mercapto-6-S-acetyl-1,2,3,4-tetra-O-acetyl-β-D-glucopyranose and 6-deoxy-6-mercapto-6-S-acetyl-1,2-O-isopropylidene-3,5-benzylidene-α-D-glucofuranose which were synthesized from corresponding 6-p-toluenesulfonyl derivatives and potassium thiolacetone in boiling acetone.

(Received April 20, 1961)
