Isolation of α -Onocerin from *Lycopodium clavatum* LINN.

A triterpenoid-like substance was separated from the chloroform extract of the leaves and stems of *Lycopodium clavatum* LINN. (Lycopodiaceae), distributed at Mt. Nyû-gasa, Nagano, Japan. The acetylation product was purified by chromatography on alumina and recrystallization from ethanol-benzene to give a diacetate, $C_{34}H_{54}O_4$, m.p. $227\sim 229^\circ$ (corr.), $[\alpha]_D^{15} : +29.0 \pm 1.0^\circ$ (in $CHCl_3$, $c=1.00$), IR: $\nu_{max}^{KBr} \text{ cm}^{-1} : 1730, 1371, 1268, 1026$ (acetoxyl); 3125, 1645, 879 (exocyclic methylene), (Anal. Calcd: C, 77.52; H, 10.33. Found: C, 77.59; H, 10.32), in the yield of more than 1.0% of dried plant material. Hydrolysis of the diacetate and recrystallization from methanol-tetrahydrofuran gave a diol, $C_{30}H_{50}O_2$, m.p. $206.5\sim 208^\circ$ (corr.), $[\alpha]_D^{15} : +17.0 \pm 2.0^\circ$ (in $CHCl_3$, $c=0.25$), IR: $\nu_{max}^{KBr} \text{ cm}^{-1} : 3390, 1032$ (hydroxyl); 3085, 1642, 885 (exocyclic methylene), (Anal. Calcd: C, 81.39; H, 11.38. Found: C, 81.26; H, 11.23). These physical constants were very similar to those of α -onocerin (α -onoceradienediol) (I).¹⁾ By the direct comparison of diol with an authentic sample, the diol was proved to be identical with α -onocerin. The catalytic reduction of diacetate and chromic oxidation of diol were also examined.

α -Onocerin is a triterpenoid, that has a very novel structure, and has been isolated from the roots of *Ononis spinosa* LINN. (Leguminosae).²⁾ This is the first example of the triterpenoid of the established structure isolated from the fern plants.

The authors are grateful to Dr. T. Kariyone and also to Prof. D.H.R. Barton, who sent the authentic sample to us. Thanks are due to Dr. T. Ooba in National Institute of Hygienic Science, and to Miss K. Iwata in Kyoto University.
