In a previous paper of this series, the reaction of 2-methoxymethylene-3-ethoxypropionitrile (I) and 2-ethoxymethyl-3-ethoxy-3-methoxypropionitrile (II) with urea derivatives were reported. This paper deals with the reactions of ethyl 3-ethoxy-2-methoxymethylenepropionate (III) with urea and N-substituted ureas.

2-Oxo-1,2,3,4-tetrahydro-5-pyrimidinemcarbonitrile (V) has already been obtained by the reaction of I (or II) with urea. Therefore, in the case of III instead of I, similar condensation would be expected.

Reaction of III with urea has carried out in ethanol solution in the presence of hydrochloric acid and a product (V), C₁₁H₁₁O₂N₄, was obtained in 72% yield. The infrared spectrum of V showed NH bands and C=O bands. Acetylation of V afforded the diacete (VII). The nuclear magnetic resonance (NMR) spectrum of VII (Table I) showed the proton signals of ethyl of ester, two N-acetyl, C₄-methylene, and C₇-methylidyne groups, respectively. From these results, V can be formulated as ethyl 2-oxo-1,2,3,4-tetrahydro-5-pyrimidinemcarboxylate. Dehydrogenation of V by the action of bromine in acetic acid gave ethyl 2-oxo-1,2-dihydro-5-pyrimidinemcarboxylate (VII), which was converted into ethyl 2-chloro-5-pyrimidinemcarboxylate (VIII) on treatment with phosphoryl chloride and N,N-dimethylaniline. Amination of VIII gave the 2-amino derivative (IX), which was saponified to afford 2-amino-5-pyrimidinemcarboxylic acid (X). 2-Amino-5-pyrimidinemcarbonitrile (XI), obtained in the previous work, was hydrolyzed to give the 5-carboxy derivative and the identity of these compounds was confirmed by comparison of their infrared spectra.

Formerly, Ballard and Johnson reported the synthesis of X from diethyl malonate and ethyl pseudothiourea via VII through longer steps than our route. Our method gave a more satisfactory yield in obtaining VII.

Reaction of III with 1,3-dimethylurea in ethanol solution in the presence of hydrochloric acid afforded a product (XII), C₁₁H₁₁O₂N₄, in 85% yield. Infrared spectrum of XII showed C=O bands, but no NH band. NMR spectrum of XII exhibited the proton signals of ethyl of ester, two N-methyl, C₄-methylene, and C₇-methylidyne groups, respectively (Table I). Thus, XII was formulated as ethyl 2-oxo-1,3-dimethyl-1,2,3,4-tetrahydro-5-pyrimidinemcarboxylate.

Reaction of III with N-methyleneurea in ethanol solution in the presence of hydrochloric acid gave a product of m.p. 95–97°, C₁₁H₁₁O₂N₂. However, this product showed two spots on a thin-layer chromatogram (TLC). NMR spectrum of this product exhibited two pairs of signals of N-methyl and NH protons whose respective relative integrated intensities are about 5:4. These facts suggest that this product is a mixture of

* Part XXX. A. Takamizawa, K. Hirai, Y. Hamashima, M. Hata: This Bulletin, 12, 558 (1964).
* Sagisu, Fukuushima-kun, Osaka (高見 正 映, 平井雅太郎).
* All NMR spectra were taken with a Varian A-60 spectrometer on about 10% solution in CDCl₃ containing about 1% tetramethylsilane (TMS) as an internal reference. Chemical shifts are expressed in ′-values and coupling constants are in c.p.s.
* TLC: alumina plate, ethyl acetate solvent, detected by I₂ vapor.
ethyl 2-oxo-3-methyl-1,2,3,4-tetrahydro-5-pyrimidin-carboxylate (XIII) and the 1-methyl isomer (XIV) in a ratio of 5:4. This mixture was subjected to column chromatography on alumina and two crystalline products, m.p. 126–127° (XIII) and m.p. 117–118° (XIV), were obtained separately. The assignment of these compounds was made as follows. NMR spectrum of XIII exhibited the signal of N-methyl protons at higher field (7.07 \( \tau \)) than that of XIV (6.88 \( \tau \)). This fact suggests that the N-methyl group in XIII should be situated at the position 3. The spectrum of XIII also exhibited a doublet (\( J=5.7 \) c.p.s.) at 1.08 \( \tau \) due to the NH group and the C-\( \text{CH}_3 \) methylidyne proton signal as a doubling.

NMR spectra of 2-oxo-3-methyl-1,2,3,4-tetrahydro-5-pyrimidincarbonitrile and 1-methyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidinecarbonitrile exhibit the signals of N-methyl groups at 7.08 and 6.88 \( \tau \), respectively.
triplet ($J=5.7$, 1.0 c.p.s.) at 2.78 $\tau$, which changed into a triplet by the addition of a small amount of deuterium oxide to the solution examined. This decoupling results from the proton exchange of the NH group. These facts indicate that the NH group is situated at a position adjacent to the C$_6$-methylidene group. Therefore, XII can be formulated as ethyl 2-oxo-3-methyl-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate.

XIV, which exhibited the signal of NH proton at 4.33 $\tau$ and a triplet due to C$_8$-methylidene proton at 2.82 $\tau$, can be formulated as the 1-methyl isomer.

Reaction of XII with N-phenylurea in ethanol solution in the presence of hydrochloric acid afforded ethyl 1-phenyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (XV) in 81% yield as the sole product and 3-phenyl isomer was not obtained. The structure of XV was confirmed by NMR spectrum. Namely, XV showed N$_2$-H proton signal at 3.91 $\tau$ and the signal of C$_8$-methylene protons of its acetate (XVI) shifted to lower field by adjacent N$_2$-acetyl group (see Table I).

**Experimental**

**Ethyl 2-Oxo-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (V)**—Urea (3.0 g.) and 9.4 g. of ethyl 2-methoxymethylthio-3-ethoxypropionate (III) were added to the solution of 250 ml of EtOH and 5 ml of conc. HCl. The mixture was refluxed for 6 hr. and concentrated in vacuo to dryness. Residual crystals were recrystallized from EtOH to give 6.1 g. (72%) of colorless prisms, m.p. 178–180°. IR $\nu_{max}$ cm$^{-1}$: 3258, 3118, 1719, 1704, 1271, 1075. UV $\lambda_{max}$; $\mu$ (log e): 214 (3.92), 288 (3.98). Anal. Calcd. for C$_{19}$H$_{18}$O$_4$N$_2$: C, 49.40; H, 5.92; N, 16.46. Found: C, 49.55; H, 6.03; N, 16.42.

**Ethyl 2-Oxo-1,3-diacetyl-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (VI)**—A mixture of 0.5 g. of V and 5 ml. of Ac$_2$O was refluxed for 4 hr. The excess reagent was removed in vacuo and the residue was distilled under reduced pressure. Colorless oil of b.p.$\alpha$ 143–145° (0.3 g.) was obtained. Anal. Calcd. for C$_{20}$H$_{20}$O$_4$N$_2$: C, 51.96; H, 5.55; N, 11.02. Found: C, 52.24; H, 5.81; N, 11.03.

**Ethyl 2-Oxo-1,2-dihydro-5-pyrimidinecarboxylate (VII)**—Hydrobromide—To a mixture of 0.5 g. of V in 10 ml. of AcOH, a solution of 0.47 g. of Br$_2$ in 2 ml. of AcOH was added and refluxed for 1 hr. Reaction mixture was concentrated in vacuo to dryness and the residual crystals (0.53 g., 62%) was recrystallized from EtOH–AcOH to give 0.48 g. (56%) of pale orange prisms, m.p. 184–186 (decomp.). UV $\lambda_{max}$: 257 $\mu$m (log e 4.19), 265, 305 $\mu$m (shoulder). Anal. Calcd. for C$_{15}$H$_{14}$O$_2$HBr: C, 33.75; H, 3.64; N, 11.25. Found: C, 33.81; H, 3.78; N, 11.66.

$^4$ Spin coupling between =CH proton and =CONH– proton in 2-oxo-2,3-dihydro-6H-1,3-thiazine-5-carbonitrile has been reported in a previous paper.1

$^7$ All melting points were taken on a Kofler hot plate and are uncorrected.
Ethyl 2-Chloro-5-pyrimidinecarboxylate (VIII)—A mixture of 0.53 g. of \( \text{VI} \cdot \text{HBr} \), 3 ml. of POCl\(_3\), and 0.3 ml. of dimethylaniline was refluxed for 1 hr. The excess reagent was removed under reduced pressure and ice H\(_2\)O was added to the residue. After the solution was made alkaline by adding dil. NaOH, it was extracted with AcOEt. The AcOEt extract was dried over anhyd. MgSO\(_4\) and AcOEt was removed. The residue was extracted with hot petr. ether, and the petr. ether extract was concentrated to dryness to afford 0.25 g. (62\%) of pale green needles, which was purified with distillation (b.p. 80\°C) to give colorless needles, m.p. 45\°C. Anal. Calcd. for C\(_4\)H\(_8\)O\(_2\)NC\(_2\): C, 50.66; H, 3.78; N, 15.01; Cl, 19.00. Found : C, 44.91; H, 3.95; N, 14.46; Cl, 19.13.

Ethyl 2-Amino-5-pyrimidinecarboxylate (IX)—A solution of crude \( \text{VIII} \) (0.9 g.) in 40 ml. of EtOH saturated with NH\(_3\) was heated at 100\°C in a tube for 1 hr. The reaction mixture was concentrated under reduced pressure and the separated crystals were collected to give 0.5 g. (62\%), m.p. 140-141\°C, of colorless prisms. Recrystallization from H\(_2\)O gave colorless prisms, m.p. 140-141\°C. Anal. Calcd. for C\(_4\)H\(_8\)O\(_2\)N\(_2\): C, 50.29; H, 5.43; N, 25.14. Found : C, 50.27; H, 5.50; N, 24.91.

2-Amino-5-pyrimidinecarboxylic Acid (X)—a) To a solution of 25 ml. of EtOH and 1.5 ml. of 10\% KOH, 0.16 g. of \( \text{X} \) was added and boiled for 1 hr. After cooling, 5 ml. of EtOH was added to the reaction mixture and the separated crystals were collected. These were dissolved in H\(_2\)O and AcOH was added to liberate 0.07 g. of colorless prisms, m.p. >290\°C. Anal. Calcd. for C\(_4\)H\(_5\)O\(_2\)N\(_2\): C, 43.17; H, 3.62; N, 30.21. Found : C, 43.41; H, 3.78; N, 29.88.

b) A suspension of 0.28 g. of \( \text{X} \) in 5 ml. of 10\% KOH was boiled for 2 hr. The reaction mixture was made acidic by adding AcOH and concentrated to one third volume. The concentrated solution was allowed to stand to afford 0.10 g. of colorless prisms, m.p. >290\°C, which was found to be identical with the sample obtained above b) by comparison of their IR spectra.

Ethyl 2-Oxo-1,3-dimethyl-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (XII)—A solution of 1.9 g. of \( \text{II} \), 0.9 g. of 1,3-dimethylelurea and 2 ml. of conc. HCl in 100 ml. of EtOH was refluxed for 16 hr. The solution was concentrated in vacuo and the residue was extracted with CHCl\(_3\). The CHCl\(_3\) extract was washed with H\(_2\)O, dried over anhyd. MgSO\(_4\), and the CHCl\(_3\) was removed. The residue was collected to afford 1.7 g. (85\%) of colorless prisms, m.p. 73-75\°C. Recrystallization from AcOEt+EtOH-petr. ether gave colorless prisms, m.p. 89-91\°C. UV 343\,000 cm\(^{-1}\) \( \varepsilon \) : 221 (3.82), 300 (3.84). Anal. Calcd. for C\(_9\)H\(_{10}\)O\(_2\)N\(_2\): C, 54.54; H, 7.13; N, 14.14. Found : C, 54.71; H, 7.20; N, 14.03.

Reaction of III with N-Methylurea—A solution of 2.96 g. of N-methylurea, 7.52 g. of \( \text{III} \), conc. HCl 4 ml. in 200 ml. of EtOH was refluxed for 8 hr. The solution was concentrated in vacuo, the residue was dissolved in CHCl\(_3\) and the CHCl\(_3\) solution was washed with dil. NaOH. After drying over anhyd. MgSO\(_4\), the CHCl\(_3\) was removed. The residue was recrystallized from benzene-petr. ether to afford 7.3 g. (84\%) of colorless needles, m.p. 95-97\°C. TLC, Rf 0.67, 0.62. Anal. Calcd. for C\(_9\)H\(_{12}\)O\(_2\)N\(_2\): C, 52.16; H, 6.57; N, 15.21. Found : C, 51.88; H, 6.55; N, 15.45.

This product was chromatographed on Al\(_2\)O\(_3\). The fractions showing the single spot at Rf 0.67 by TLC was collected and the removal of the solvent gave 2.2 g. of colorless crystals, which was recrystallized from H\(_2\)O to give 2.0 g. of colorless needles, m.p. 117-118\°C. UV 343\,000 cm\(^{-1}\) \( \varepsilon \) : 214 (3.91), 296 (4.01). IR \( \nu_{\text{max}} \) cm\(^{-1}\) : 3232, 3127, 1703, 1682. Anal. Found : C, 52.49; H, 6.81; N, 15.31. The NMR spectrum shows these crystals to be ethyl 1-methyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (XIV). The fractions, eluted by the mixture of CHCl\(_3\) and EtOH showed a single spot at Rf 0.62, and the removal of the solvent gave the raw 1.92 g. of colorless crystals. Recrystallization from H\(_2\)O afforded colorless needles, m.p. 126-127\°C. UV 343\,000 cm\(^{-1}\) \( \varepsilon \) : 219 (3.93), 289 (3.94). IR \( \nu_{\text{max}} \) cm\(^{-1}\) : 3216, 3113, 1703, 1648. Anal. Found : C, 51.93; H, 6.74; N, 15.36. The NMR spectrum shows these crystals to be ethyl 2-oxo-3-methyl-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (XIII).

Ethyl 1-Phenyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (XV)—A solution of 1.9 g. of \( \text{II} \), 1.4 g. of N-phenylurea, and 2 ml. of conc. HCl in 100 ml. of EtOH was refluxed for 3 hr. The solution was concentrated in vacuo to dryness, and the residue was dissolved in CHCl\(_3\). The CHCl\(_3\) solution was washed with dil. K\(_2\)CO\(_3\) and dried over anhyd. MgSO\(_4\). Removal of the CHCl\(_3\) gave 2.0 g. (81\%) of colorless crystals. Recrystallization from EtOH afforded colorless needles, m.p. 159-160\°C. UV 343\,000 cm\(^{-1}\) \( \varepsilon \) : 295 (4.04), 236 (3.96) (shoulder). IR \( \nu_{\text{max}} \) cm\(^{-1}\) : 3241, 3135, 1702, 1229, 1075. Anal. Calcd. for C\(_{13}\)H\(_{15}\)O\(_2\)N\(_2\): C, 63.40; H, 5.73; N, 11.38. Found : C, 63.16; H, 5.93; N, 11.00.

Ethyl 1-Phenyl-2-oxo-3-acetyl-1,2,3,4-tetrahydro-5-pyrimidinecarboxylate (XVI)—The mixture of 0.3 g. of crude XV and 3 ml. of AcO\(_2\) was refluxed for 3 hr. The solution was concentrated in vacuo and the residue was distilled under reduced pressure. Colorless oil (0.4 g.), b.p. 195\°C, was obtained. Anal. Calcd. for C\(_{17}\)H\(_{17}\)O\(_2\)N\(_2\): C, 62.49; H, 5.59; N, 9.72. Found : C, 62.01; H, 5.29; N, 9.61.

The authors express their deep gratitude to Prof. M. Tomita and Prof. S. Uyee of Kyoto University, and Dr. K. Takada, Director of this laboratory, for their encouragement. Thanks are also due to Dr. K. Tori and Mr. K. Aono for taking NMR spectra, to Messrs. I. Tanaka and M. Takasuka for ultraviolet and infrared spectral measurements, to the members of analytical section of this laboratory for elemental analyses, and to Mr. T. Ishiba for his technical assistance.
Summary

Ethyl 2-methoxymethylene-3-ethoxypropionate (III) undergoes condensation with urea, and N-substituted urea in ethanol solution in the presence of hydrochloric acid. With urea, III gave ethyl 2-oxo-1,2,3,4-tetrahydro-5-pyrimidincarboxylate (V), with N-methylurea a mixture of ethyl 2-oxo-3-methyl-1,2,3,4-tetrahydro-5-pyrimidinincarboxylate (XIII) and its isomeric 1-methyl compound (XIV), which was separated into each isomer, and with N-phenylurea the 1-phenyl compound (XV) was exclusively obtained. Conversion into pyrimidines was achieved by dehydrogenation and subsequent chlorination of V.

(Received April 11, 1964)

(School of Medicine, Gunma University, and Research Laboratory, Teikoku Hormone Mfg. Co., Ltd.)

Androst-5-ene-3β,16α,17β-triol, androst-5-ene-3β,16β,17β-triol, and 3β,16α-dihydroxyandrost-5-en-17-one are all steroid metabolites isolated from human urine. In our course of study on steroid metabolism, these compounds became necessary as standard samples. Androst-5-ene 3β,16α,17β-triol was first prepared by Huffman and Lott, from 3β-hydroxyandrost-5-en-17-one through nine steps, but much more convenient method seems not to be reported. This paper describes much more convenient method of synthesis of androst-5-ene-3β,16α,17β-triol and related compounds.

In Huffman’s method of synthesis, key steps for introduction of oxygen at C-16 contain three reactions (I→II→III→IV); the condensation of 17-oxo steroid (I) with isomyl nitrite to 16-oximino-17-oxo compound (II), reductive hydrolysis of II with zinc dust in aqueous acetic acid to 17β-hydroxy-16-oxo compound (III) and reduction of III with sodium amalgam to 16α,17β-glycol (IV). The last step (III→IV) is not stereospecific reaction, so that considerable amount of 16β,17β-glycol is also produced. On the other hand, Gallagher and his coworkers developed another method of synthesis of 16α,17β-glycol from 17-oxo steroid which is more stereospecific; I is transformed into 17-ene acetate (V), which on oxidation with peracid gave the oxide (VI), followed by reduction with lithium aluminum hydride to 16α,17β-glycol (V). This elegant method could be applied for synthesis of androst-5-ene-3β,16α,17β-triol.
