Studies on Pillaromycin A. I.¹⁾ The Properties of Pillaromycin A and Pillaromycinone

MITSUKO ASAI

Microbiological Research Laboratories, Research and Development Division,
Takeda Chemical Industries, Ltd.²⁾

(Received December 25, 1969)

A molecular formula, $C_{28}H_{28}O_{11}$, has been given for pillaromycin A. Acid hydrolysis of pillaromycin A afforded an aglycone, pillaromycinone, $C_{20}H_{18}O_7$ and a new sugar, pillarose, $C_8H_{12}O_5$. From the results of spectrometrical and chemical studies on pillaromycinone and its derivatives the presence of the following functional groups was elucidated in pillaromycinone; two *sec*-hydroxyls, a *tert*-hydroxyl, two phenolic hydroxyls, a chelated carbonyl and an acetyl conjugated with α,β -unsaturated double bond.

Pillaromycin A (I, PMA) is a yellow antibiotic obtained from the culture of *Streptomyces flavovirens* No. 65786. This antibiotic has a colchicine-like antitumor activity and an ultraviolet and visible (UV) spectra similar to those of chromomycin A₃³⁾ and A₂⁴⁾ but it is less toxic than above antibiotics. These facts have stimulated the author's interest on its chemical structure.

PMA (I) was extracted with ethyl acetate (EtOAc) from the culture filtrate and crystallized from solvents such as ethanol, acetone, ether and EtOAc. The solvent free crystals of I exhibited mp 208°, $C_{28}H_{28}O_{11}$,⁵⁾ and were soluble in aq. sodium bicarbonate (NaHCO₃) solution. I reduced Fehling's reagent and gave a blue color with the aq. FeCl₃:K₃Fe(CN)₆ solution (Barton, *et al.*⁶⁾), but showed negative Mg(OAc)₂ reaction. Its characteristic UV spectrum (Fig. 1) suggested the presence of carbonyls and aromatic rings, and its infrared absorption (IR) spectrum (Fig. 1) also showed the carbonyl bands at 1720 (isolated), 1678 (conjugated) and 1635 (chelated) cm⁻¹. The nuclear magnetic resonance (NMR)⁷⁾ spectra (Fig. 2 in CD₃OD,

1) M. Shibata, E. Higashide, K. Wada, K. Mizuno, M. Asai, M. Imanishi and A. Miyake, Japan. Patent S. 41-7839 (1966); M. Shibata, M. Asai, K. Mizuno, A. Miyake and S. Tatsuoka, *Proc. Japan Acad.*, **40**, 296 (1964).

2) Location: Juso, Higashiyodogawa-ku, Osaka.

3) K. Mizuno, *J. Antibiotics* (Tokyo), *Ser. A*, **16**, 22 (1963).

4) K. Mizuno, M. Imanishi, M. Asai, A. Miyake and M. Shibata, Japan. Patent S. 40-14591 (1965).

5) The molecular weight of crystalline Pillaromycin A (I) containing one molar diethylether was 619.7 ± 5 from X-ray analysis.

6) G.M. Barton, R.S. Evans and J.A.F. Gardner, *Nature*, **170**, 249 (1952).

7) NMR spectra were measured on a Varian HA-100 or A-60A spectrometer. The chemical shifts were expressed in δ value from TMS (internal reference).

Fig. 1. UV and IR spectra of Pillaromycin A (I)

Fig. 2. NMR Spectra of Pillaromycin A (I) (100 Mc)

d_5 -pyridine, 100 Mc) presented the signals which were assigned to CH-CH₃ (one), CH₃ (one, singlet), aromatic and vinyl protons (five), and alicyclic methine or methylene protons (six).

Full acetylation of I gave the pentaacetate (IV), mp 195°, C₃₈H₃₈O₁₆, showing that the chelated carbonyl in I had disappeared. The NMR spectrum (in CDCl₃) of IV showed new signals assigned to alcoholic O-Ac (three) and phenolic O-Ac (two). This fact indicated that I had three acetyltable alcoholic hydroxyls and two phenolic hydroxyls.

Hydrolysis of I with aqueous acetic acid gave an aglycone named pillaromycinone (II, PMN) and a new sugar named pillarose (III). From the hydrolysate II was extracted with EtOAc, and crystallized from the same solvent, mp 202°, C₂₀H₁₈O₇. II gave a blue color with the reagent of Barton, *et al.*⁶⁾ The UV spectrum of II (Fig. 3) was closely similar to that of I. In IR spectrum of II the presence of the characteristic bands at 1678 (conjugated CO) and 1640 cm⁻¹ (chelated CO) and the absence of an isolated carbonyl were observed. In its NMR spectra (Table I, Fig. 4 in CD₃OD, d_5 -pyridine) the signals were assigned to CH₃ (one, singlet), alicyclic protons (three), O-C-H (two) and aromatic and vinyl protons (five). II was insoluble in CDCl₃, therefore its isopropylidene derivatives (soluble in CDCl₃, see in Part II) were used for the NMR study of II to show the presence of two chelated hydroxyls in the lower magnetic field.

Stepwise acetylation of II gave PMN tetraacetate (V), needles, mp 241°, C₂₈H₂₆O₁₁. In its IR spectrum the presence of OH band (3400 cm⁻¹) was observed. The NMR spectrum of V (Table I) in d₅-pyridine showed the signals assigned to alcoholic O-Ac (two), phenolic O-Ac (two), CH₃ (one, s⁸), alicyclic protons (three), *tert*-OH (one, substituted with D₂O), Ac-O-C-H (two), vinyl proton (one, s.) and aromatic protons (four), showing that the two chelated hydroxyls in II had disappeared. These data indicated that two *sec*-hydroxyls and two phenolic hydroxyls in II were acetylated. Prolonged acetylation of V yielded PMN pentaacetate (VI). In the IR and NMR spectra of VI no signal of the *tert*-hydroxyl was found, but gave a new signal of an alcoholic O-Ac (1.97 ppm).

PMN (II) gave PMN monothiosemicarbazone (VII), and PMN mono-2,4-dinitrophenylhydrazine (VIII). The absorptions at 303 mμ in VII and 376 mμ in VIII indicated that VII and VIII had been derived from an α,β-unsaturated carbonyl compound.⁹ The CH₃ signal (clean singlet) in the NMR spectrum (in d₅-pyridine) of II seen at 2.31 ppm was therefore ascribed to an acetyl conjugated with α,β-unsaturated bond. This was also supported by dihydropillaromycinone (IX), mp 196°, C₂₀H₂₀O₇, a catalytic reduction product of II in methanol over Adam's Pt. The IR spectrum of IX showed that the conjugated carbonyl had been altered into an isolated carbonyl.

Catalytic reduction of II in methanol over Pd-C gave three reduction products. The main product was named pillaronone (X, α-substance),¹⁰ mp 235°, C₂₀H₁₈O₅, and the minor components were dihydroanhydroxypillaromycinone (XI, β-substance), mp 246°, C₂₀H₂₀O₆, and tetrahydrodianhydroxypillaromycinone (XII, γ-substance), mp 260°, C₂₀H₂₂O₅. The ε values of IX and XI at 233 mμ were smaller than those of I and II by ca. 8000. The IR spectrum of XI showed the band of an isolated carbonyl. These changes in absorptions were interpreted that the double bonds conjugated with an acetyl in I and II were hydrogenated to give IX and XI.

8) s=singlet, d=doublet, t=triplet, q=quartette, m=multiplet.

9) F.A. Braude and E.R.H. Jones, *J. Chem. Soc.*, **1945**, 498.

10) X was also obtained in good yield by reacting IX with C₂H₅SH·HCl in methanol followed by the desulfurization of the given monomercaptal (XIII) with Raney-Ni in ethanol.

From the above observations seven oxygen atoms in II are characterized as follows: two *sec*-hydroxyls, one *tert*-hydroxyl, two chelated phenolic hydroxyls, one acetyl and one chelated conjugated carbonyl.

Stepwise acetylation of XI gave the triacetate (XIV) and the tetraacetate (XV). The IR spectrum of XIV showed the characteristic bands of OH (3400 cm^{-1}), phenolic O-CO (1785), alcoholic O-CO (1755), isolated CO (1720) and conjugated CO (1690). In the NMR spectrum (in CDCl_3) of XIV there appeared signals of alcoholic OAc (one) and phenolic OAc (two). The spectrum also showed that the methyl signal of CO-CH₃ (singlet) moved to 2.08 ppm, the methine signal of O- $\overset{|}{\text{C}}$ -H (one) shifted lowerfield and two signals of chelated phenolic hydroxyls had disappeared. XV showed no band of hydroxyl in the IR spectrum and showed

two signals of alcoholic OAc and no signal of methine proton shifted lowerfield in the NMR spectrum.

Thus, the six oxygen atoms in XI were assigned as follows:

Readily acetyltable OH	
(<i>sec</i> -hydroxyl) one	
Hardly acetyltable OH	
(<i>tert</i> -hydroxyl) one	
Acetyltable phenolic OH	two
Isolated CO	one
Chelated conjugated CO	one

The UV and IR spectra of X are shown in Fig. 5. The value of ϵ at $233\text{ m}\mu$ was lower than those of I and II, and in the IR spectrum the band of isolated carbonyl recognized in XI had disappeared.

Acetylation of X gave the monoacetate (XVI), $\text{C}_{22}\text{H}_{20}\text{O}_6$ and the diacetate (XVII), mp 248° , $\text{C}_{24}\text{H}_{22}\text{O}_7$. In the IR spectrum of XVII, the bands of phenolic O-CO were recognized, but neither band of hydroxyl nor alcoholic O-CO was recognized. This indicated the absence of alcoholic hydroxyl in X. The NMR spectrum of XVII (Table II) showed the presence of phenolic O-Ac (two), CH₃ (one, 1.69 ppm, s, shifted higher field), O- $\overset{|}{\text{C}}$ -H (one), aromatic protons (four), new alicyclic protons (five) and the absence of the vinyl proton. The fact that no acetyl was recognized in X may be interpreted that the CH₃CO recognized in IX and XI had been converted into a CH₃- $\overset{|}{\text{C}}$ - in X.

Reaction of X with 2,4-dinitrophenylhydrazine in HCl solution yielded the 2,4-dinitrophenylhydrazone (XVIII). The absorption at $360\text{ m}\mu$ is specific to the 2,4-dinitrophenylhydrazone of isolated carbonyl.⁹ XVIII was found to be identical with the 2,4-dinitrophenylhydrazone of XI, and this finding was explained that in HCl solution X was converted into XI.

Thus, the five oxygen atoms in X were ascribed to:

Acetyltable phenolic OH	two
Chelated conjugated CO	one
Ether oxygen	two

			1.5		1.5								

The two ether oxygens in X were seemed to be derived from the isolated carbonyl, *sec*-hydroxyl and *tert*-hydroxyl of XI.

In short, the above facts may be interpreted as follows: A) II has the $>\text{C}=\text{C}-\text{COCH}_3$ structure (CH_3 2.31 ppm), B) the double bond is saturated when catalytically hydrogenated over Pt or Pd-C to form an isolated COCH_3 in IX and XI (CH_3 2.09 ppm), and C) when Pd-C is used, the reduction proceeds further to form a ketal in X (CH_3 1.69 ppm) which is cleaved with a strong acid.

Chart 1

Experimental¹¹⁾

Pillaromycin A (I, PMA)—Culture filtrate (500 liter) of *Streptomyces flavovirens* No. 65786 was extracted at pH 2 with EtOAc (75 liter $\times$ 2). The crude yellow precipitate (200 g) obtained from the extract was dissolved in EtOAc (3 liter) and the solution extracted with aq. 2% NaHCO_3 (0.5 liter $\times$ 2). The aqueous layer was adjusted to pH 3 with HCl and extracted with EtOAc (0.75 liter $\times$ 2). The EtOAc layer was passed through a charcoal column (3.7 $\times$ 38 cm), then the active component was eluted with the same solvent. The active eluate was concentrated and ethanol (ca. 300 ml) was added to the concentrate to give crystalline pillaromycin C.¹⁾ After filtration the filtrate was mixed with ether (ca. 1.2 liter) and placed in cooled place to yield yellow prisms (ca. 20 g) of I containing one mole of ether. The crystalline recrystallized from ethanol-ether lost the ether at 120° and melted at 208°, $[\alpha]_D^{25} -37^\circ$ ($c=1.0$, MeOH). Crystallization from acetone, ethanol and EtOAc gave crystals having one mole of crystallization solvent, respectively. The crystalline having one mole of EtOAc lost the EtOAc when dried at 55°. *Anal.* Calcd. for $\text{C}_{28}\text{H}_{28}\text{O}_{11}$: C, 62.21; H, 5.22. Found: C, 61.92; H, 5.15. *Anal.* Calcd. for $\text{C}_{28}\text{H}_{28}\text{O}_{11} \cdot \text{C}_4\text{H}_{10}\text{O}$: C, 62.53; H, 6.23. Found: C, 62.56; H, 6.40. UV

11) All melting points were uncorrected.

$\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 220 (37.6), 275 (41.4), 298 (8.0), 309 (6.5), 431 (8.75) (Fig. 1 shows IR and UV spectra, Fig. 2 shows NMR spectra).

Pillaromycinone (II, PMN)—I (50 g) in 50% acetic acid (1.5 liter) was hydrolyzed at 75° for 3 hr. The hydrolyzate was extracted with EtOAc (0.4 liter $\times$ 3). The EtOAc extract was treated with water (1.5 liter) containing NaHCO₃ (400 g), washed with water, dried and concentrated. The resulting yellow precipitate (30 g) was recrystallized from EtOAc (300 ml) to provide yellow needles, mp 202° molecular wt. 366.2 (osmotic method) $[\alpha]_D^{25} + 550^\circ$ ($c=1.0$, MeOH). *Anal.* Calcd. for C₂₀H₁₈O₇: C, 64.86; H, 4.89. Found: C, 64.80; H, 4.82. UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 221 (36.9), 274 (43.8), 296 (7.8), 308 (6.2), 428 (8.83) (Fig. 3 shows IR and UV spectra, Fig. 4 and Table I show NMR spectra, respectively).

Pillaromycin A Pentaacetate (IV, PMA Pentaacetate)—I (1 g) was acetylated with acetic anhydride (3 ml) in pyridine (6.6 ml) for 20 hr. A crude acetate (1.3 g) obtained from the reaction mixture was dissolved in benzene–EtOAc (1:1) containing 1% oxalic acid and passed through a silica gel column (50 g) (0.05–0.20 mm, Merck) and developed with the same solvent. The blue green fluorescent eluate was concentrated (ca. 10 ml) and added cyclohexane to yield a crystalline powder, mp 195°, $[\alpha]_D^{25} + 27^\circ$ ($c=1.0$, MeOH). *Anal.* Calcd. for C₃₈H₃₈O₁₆: C, 60.79; H, 5.10. Found: C, 60.69; H, 5.39. IR $\nu_{\text{max}}^{\text{CHCl}_3}$ cm⁻¹: 1785 (CO), 1755 (CO), 1725 (CO), 1685 (CO). UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 220 (32.6), 261.5 (45.08), 288 (5.62), 301 (8.21), 311 (7.28), 368 (3.25). NMR (100 Mc in CDCl₃): 2.43 (3H, s, COCH₃), 2.34 (6H, s, COCH₃), 2.23 (3H, s, COCH₃), 2.05 (3H, s, COCH₃), 1.97 (3H, s, COCH₃). Mass Spectrum¹² m/e : 708 (M⁺-42).

Pillaromycinone Tetraacetate (V, PMN Tetraacetate)—II (1 g) in pyridine (6.6 ml) was acetylated with acetic anhydride (3 ml) for 2 hr. From the resulting mixture a crude powder (1.3 g) was obtained. The product was recrystallized from EtOAc, mp 241°, $[\alpha]_D^{25} + 230^\circ$ ($c=1.0$, MeOH). *Anal.* Calcd. for C₂₈H₂₆O₁₁: C, 62.45; H, 4.86. Found: C, 62.57; H, 4.80. IR $\nu_{\text{max}}^{\text{CHCl}_3}$ cm⁻¹: 3400 (OH), 1770 (CO), 1750 (CO), 1695–1690 (CO). UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 220 (33.2), 261 (45.18), 288 (5.28), 300 (8.02), 310 (7.10), 366 (3.345). NMR (100 Mc in CDCl₃) shows in Table I. Mass Spectrum m/e : 538 (M⁺).

Pillaromycinone Pentaacetate (VI, PMN Pentaacetate)—II (100 mg) in pyridine (0.7 ml) was acetylated with acetic anhydride (0.3 ml) for 24 hr. The reaction mixture was treated with ice–water to yield a precipitate (80 mg). Silica gel G (Merck) (30 g) in EtOAc (68 ml) containing 1% oxalic acid was spread on a large glass plate (20 $\times$ 20 cm) so as to prepare a thin-layer. A solution of the above crude product in EtOAc was applied to the thin-layer and developed with benzene–EtOAc (1:1) containing 0.5% oxalic acid. The blue fluorescent band was extracted with EtOAc, the extract was concentrated and treated with petroleum ether. The resulting white powder was recrystallized with EtOAc–ether–petroleum ether. *Anal.* Calcd. for C₃₀H₂₈O₁₂: C, 62.08; H, 4.83. Found: C, 61.88; H, 4.75. IR $\nu_{\text{max}}^{\text{CHCl}_3}$: No. OH band. UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 215 (35.35), 260 (42.70), 288 (sh), 300 (7.38), 310 (7.00), 360 (3.02). NMR (60 Mc in CDCl₃): 2.02 (3H, s), 2.08 (3H, s), 2.11 (3H, s), 2.38 (6H, s), 2.44 (3H, s, COCH₃). Mass Spectrum m/e : 580 (M⁺), 538 (M⁺-42).

Pillaromycinone Monothiosemicarbazone (VII)—The mixture of II in ethanol (10 ml) and thiosemicarbazide (100 mg) in water (10 ml) was left standing overnight. The resulting crystals were recrystallized from 50% ethanol, mp 250° (decomp.). *Anal.* Calcd. for C₂₁H₂₁O₆N₃S $\cdot$ H₂O: C, 54.71; H, 4.99; S, 6.94. Found: C, 54.67; H, 4.98; S, 6.46. UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 223 (44.8), 273 (55.38), 303 (36.05), 428 (12.22).

Pillaromycinone Mono-2,4-dinitrophenylhydrazine (2,4-DNPH) (VIII)—To a solution of II (500 mg) (1.36 mmole) in methanol (ca. 10 ml) was added a solution of 2,4-dinitrophenylhydrazine (2,4-DNP) (270 mg) (1.36 mmole) in 4N HCl (20 ml). The separated crystalline precipitate was collected and washed with methanol, EtOAc and ether successively, mp 260° (decomp.), $[\alpha]_D^{25} + 775^\circ$ ($c=1.0$, pyridine). *Anal.* Calcd. for C₂₆H₂₂O₁₀N₄ $\cdot$ H₂O: C, 54.93; H, 4.25; N, 9.85. Found: C, 55.40; H, 4.11; N, 9.65. UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 221 (34.40), 273 (38.50), 298 (9.9), 310 (7.7), 376 (24.8), 422 (18.56).

Dihydropillaromycinone (IX)—A solution of II (1 g) in methanol (40 ml) was subjected to catalytic reduction on Adam's platinum oxide (25 mg), until 2 molar equivalents of H₂ were absorbed. From the reaction mixture a crude yellow product (0.8 g) was obtained. The product was dissolved in EtOAc (50 ml), passed through a charcoal column (1 g) and developed with EtOAc to give a yellow fraction, which yielded yellow crystals containing 1 mole of crystallization EtOAc, mp 196° $[\alpha]_D^{25} + 174.7^\circ$ ($c=1.0$, MeOH). *Anal.* Calcd. for C₂₀H₂₀O₇ $\cdot$ C₄H₈O₂: C, 62.59; H, 6.12. Found: C, 62.61; H, 5.75. IR $\nu_{\text{max}}^{\text{KBr}}$ cm⁻¹: 1700 (CO). UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 221 (26.50), 273 (44.0), 297 (5.58), 308 (4.76), 422 (8.9). NMR (100 Mc in d₅-pyridine): 2.14 (3H, s, COCH₃).

Pillarone (X)—A solution of II (1 g) in methanol (40 ml) was subjected to catalytic reduction on palladium–carbon, until 3 molar equivalents of hydrogen were absorbed. The reduction product was obtained as needles, mp 235°, $[\alpha]_D^{25} + 135^\circ$ ($c=1.0$, acetone). *Anal.* Calcd. for C₂₀H₁₈O₅: C, 70.99; H, 5.36; O, 23.64. Found: C, 70.60; H, 5.39; O, 23.84. IR: Fig. 5. UV $\lambda_{\text{max}}^{\text{EtOH}}$ $m\mu$ ($\epsilon \times 10^{-3}$): 221 (26.5), 272 (46), 297 (5.2), 308 (4.5), 420 (8.9). NMR (100 Mc in d₅-pyridine): Table II.

Dihydroanhydroxy PMN (XI, β -substance), Dihydroandihydroxy PMN (XII, γ -substance)—The crude substance obtained by concentrating the mother liquor of pillarone was treated with a little methanol.

The dissolved part was concentrated to obtain β -substance (XI), mp 246°, which was recrystallized from MeOH. The insoluble part was recrystallized from EtOAc:glacial acetic acid to give γ -substance, mp 260° (XI). *Anal.* Calcd. for $C_{20}H_{20}O_6$: C, 67.40; H, 5.65. Found: C, 67.15; H, 5.70. $[\alpha]_D^{25} +197^\circ$ ($c=0.5$, MeOH). IR $\nu_{\max}^{KBr}$ cm^{-1} : 3400, 3200 (OH), 1700 (CO), 1635 (CO). UV $\lambda_{\max}^{EtOH}$ $m\mu$ ($\epsilon \times 10^{-3}$): 220 (26.5), 270 (48), 296 (5.4), 306 (4.7), 420 (8.3). NMR (100 Mc in d_5 -pyridine): 2.09 (3H, s, COCH₃), 1.96–2.3 (4H, m, $-\overset{|}{\underset{|}{CH_2}}-$), 2.73 (1H, m, $-\overset{|}{\underset{|}{CH}}-$), 2.97 (2H, m, $-\overset{|}{\underset{|}{CH_2}}-$), 3.48 (1H, m, $-\overset{|}{\underset{|}{CH}}-$), 4.21 (1H, m, $-\overset{|}{\underset{|}{C}}-\overset{|}{O}$) (XII). *Anal.* Calcd.

for $C_{20}H_{22}O_5$: C, 70.02; H, 6.43. Found: C, 69.99; H, 6.43. IR $\nu_{\max}^{KBr}$ cm^{-1} : 3350 (OH), 1635 (CO), 1602, 1605 (C=C). UV $\lambda_{\max}^{EtOH}$ $m\mu$ ($\epsilon \times 10^{-3}$): 220 (23.25), 267 (44.10), 295 (4.48), 305 (sh.), 407 (7.35). NMR (60 Mc in d_5 -pyridine): 1.38 (dH, d, CH-CH₃).

Pillaronone Monomercaptal (XIII)—The mixture of dihydro PMN (IX) (5 g) in methanol (15 ml) and ethylmercaptan (30 ml) was saturated with dry HCl gas and left standing for 4 hr. The solvent was distilled, ether was added and the separated crystals (1.8 g) were recrystallized from ethanol:ether, mp 198°. *Anal.* Calcd. for $C_{22}H_{22}O_5S$: C, 66.31; H, 5.56; S, 8.04. Found: C, 66.33; H, 5.46; S, 7.61. IR $\nu_{\max}^{KBr}$ cm^{-1} : 3420 (OH), 2700–2800 (chelated OH), 1630 (chelated CO).

A solution of XIII (1 g) in ethanol (100 ml) was boiled with Raney-Ni for ca. 8 hr. After removing the Ni, the filtrate was concentrated and the resulting product was dissolved in EtOAc. The solution was treated with aqueous sodium hydrosulfite, dried and concentrated to give crystals of pillaronone (X).

Dihydroanhydroxy PMN Tetraacetate (XV, β -Substance Tetraacetate)—The method is similar to that of pillaronone diacetate (XVII). mp 248°. *Anal.* Calcd. for $C_{28}H_{28}O_{10}$: C, 64.12; H, 5.38. Found: C, 64.02; H, 5.24. IR $\nu_{\max}^{KBr}$ cm^{-1} : 1775, 1735, 1690 (CO), 1620, 1600 (C=C). UV $\lambda_{\max}^{EtOH}$ $m\mu$ ($\epsilon \times 10^{-3}$): 217 (26.50), 257 (48.75), 288 (5.08), 298 (7.55), 310 (5.88), 360 (2.89). NMR (60 Mc in $CDCl_3$): 2.07 (3H, s, COCH₃), 2.08 (3H, s, C-COCH₃), 2.14 (3H, s, COCH₃), 2.39 (3H, s, C₆H₅-O-COCH₃), 2.49 (3H, s, C₆H₅-O-COCH₃).

Pillaronone Monoacetate (XVI)—X (100 mg) in pyridine (1.2 ml) was acetylated with acetic anhydride (0.5 ml) for 18 hr. From the resulting mixture a crude product (100 mg) was obtained and crystallized with ethanol-EtOAc to yield pillaronone monoacetate. mp 237°. *Anal.* Calcd. for $C_{22}H_{20}O_6$: C, 69.46; H, 5.29. Found: C, 69.25; H, 5.15. NMR (60 Mc in $CDCl_3$): 2.36 (3H, s, COCH₃), 14.65 (1H, broad s, chelated OH).

Pillaronone Diacetate (XVII)—X (100 mg) in pyridine (1.2 ml) was acetylated with acetic anhydride (0.5 ml) at 65° for 3 hr and then at room temperature for 40 hr. The reaction mixture was treated with ice-water (20 ml) to separate a yellowish white precipitate (100 mg). The product was dissolved in hot ethanol-EtOAc, then pillaronone diacetate (XIII) separated out from the solution on standing. The crystals were recrystallized from the same solvent. mp 248°. *Anal.* Calcd. for $C_{24}H_{22}O_7$: C, 68.24; H, 5.25. Found: C, 68.17; H, 5.32. IR $\nu_{\max}^{KBr}$ cm^{-1} : 1770, 1690 (CO), 1620, 1600 (C=C). UV $\lambda_{\max}^{EtOH}$ $m\mu$ ($\epsilon \times 10^{-3}$): 217 (26.92), 257 (49.38), 288 (5.28), 299 (7.65), 310 (5.92), 360 (3.14). NMR (100 Mc in $CDCl_3$): Table II.

Dihydroanhydroxy PMN-2,4-DNPH (XVIII, 2,4-DNPH of β -Substance)—A solution of β -substance (XI) (100 mg) (0.29 mmole) in methanol (30 ml) was reacted with a solution of 2,4-DNP (58 mg) (0.29 mmole) in 4N HCl (15 ml) for 30 min at room temperature. The resulting precipitate was washed with water and ethanol to remove the soluble part. The insoluble yellow powder (ca. 50 mg) was dissolved in a mixture of EtOAc (30 ml), ethanol (40 ml) and acetic acid (4 drops) by warming and left cooling to separate crystals, mp >300°. *Anal.* Calcd. for $C_{28}H_{24}O_9N_4$: C, 58.21; H, 4.51; N, 10.44. Found: C, 58.69; H, 4.50; N, 10.25. UV $\lambda_{\max}^{EtOH}$ $m\mu$ ($\epsilon \times 10^{-3}$): 221 (29.0), 272 (38.90), 296 (5.93), 310 (6.53), 360 (16.70), 415 (11.10).

This compound was also obtained from X as follows: A solution of X (100 mg) (0.296 mmole) in methanol (30 ml) was added to a solution of 2,4-DNP (58 mg) (0.295 mmole) in 4N HCl (15 ml) at 50° and the mixture was left standing for 3 hr at room temperature. The separated precipitate was collected and crystallized from ethanol.

Acknowledgement The author is grateful to Dr. S. Tatsuoka, General Manager of this Division and Dr. R. Takeda, Research Manager of this Laboratories, in permitting the publication of this paper and encouragement throughout the present work. Thanks are to Drs. K. Nakazawa, M. Shibata, A. Miyake and K. Mizuno for their valuable advices. The author is also indebted to Mr. M. Imanishi, K. Wada, H. Yamana for their cooperation in the present work and to the members of the analytical section for elementary analyses.
