Studies on Organic Sulfur Compounds. VIII.¹⁾ The Reaction of Alkoxy carbonyl Isothiocyanates and 2-Aminothiazole²⁾

MITSUO NAGANO, JUNZO TOBITSUKA, TAKASHI MATSUI
and KOZO OYAMADA

Agricultural Chemical Research Laboratories, Sankyo Co., Ltd.³⁾

(Received May 20, 1972)

The reactions of some alkoxy carbonyl isothiocyanates (2) with 2-aminothiazol (15) afforded thiazolo[3,2-*a*]-*S*-triazine-4-thio-2-one (27), *N*-alkoxy carbonyl-*N'*-(2-thiazolyl)-thioureas (A), alkyl-*N*-(2-thiazolyl)carbamates (B), *N*-alkoxy carbonyl thiocarbamates (C) and thiocyanic acid (31). However, in the case using phenoxycarbonyl isothiocyanate (59), the corresponding 1:1 adduct of (59) and (15) could not be obtained, but thiazolo-[3,2-*a*]-*s*-triazine-2-thio-4-one (32) was isolated, besides the cyclic compound (27), thiazolyl carbamate (60) and phenol.

Since ever the synthesis of alkoxy carbonyl isothiocyanates and their addition reactions with some alkyl (or aryl) amines and alkanols were reported by R.E. Doran^{4,5)} and A.E. Dixon *et al.*,⁶⁻⁸⁾ until a recent date other studies on the chemical behavior of the alkoxy carbonyl isothiocyanates were rarely found in the literature. However, in 1963 A. Takamizawa *et al.*⁹⁾ isolated the two structural isomers, namely alkoxy carbonyl thiocyanates and isothiocyanates, from the reaction mixtures of potassium thiocyanate and chloroformates, and presented physical data for the two isomers. Since then a number of the interesting addition reactions of alkoxy carbonyl isothiocyanates with some enamines, imines, amidines or diazo compounds have been reported. For example, Goerdeler and co-workers¹⁰⁻¹²⁾ prepared 4-thiouracils (4) from β -aminocrotonic acid derivatives (1) and some alkoxy carbonyl isothiocyanates. Lamon¹³⁾ obtained 1-(*N*-carboethoxythiocarbamoyl)-2-(*N*-morpholino)cyclohexene (7) by the addition reaction of 1-(*N*-morpholino)cyclohexene (6) and ethoxycarbonyl isothiocyanate (5). Goerdeler and Neuffer¹⁴⁾ reported that ethoxycarbonyl isothiocyanate (5) reacted with amidinyl compounds (8), namely amidines, isoureas, isothiureas and guanidines, to give *s*-triazine-4-thio-2-ones (9). It was also reported that the isothiocyanate (5) formed a six-membered heterocycle (11) by means of cycloaddition with benzylidene *N*-methyl imine.¹⁵⁾ Furthermore, it has been known that 5-phenoxycarbonylamino-1,2,3-thiadiazoles (14) could

be prepared by 1,2-cycloaddition of phenoxy carbonyl isothiocyanate (**12**) and diazocompounds (**13**).¹⁶⁾

There are no reports concerning the reactions of 2-aminoazoles and alkoxy carbonyl isothiocyanates. The present paper describes the reactions of some alkoxy carbonyl isothiocyanates and 2-aminothiazole. This amine may possibly exist in two forms, namely in an amino (**15**) and an imino form (**16**), in some solvents.¹⁷⁾ Supposedly then the addition reaction of alkoxy carbonyl isothiocyanates with 2-aminothiazole could afford two structurally isomeric adducts (**17** and **18**). However, it is known that treatment of 2-aminothiazole (**15**) and 2-aminobenzothiazole (**21**) with methyl isothiocyanate (**19**) and benzoyl isothiocyanate (**22**) gave the corresponding adducts (**20**¹⁸⁾ and **23**¹⁹⁾ respectively. Schobel *et al.*¹⁹⁾ reported also that the reaction of benzoyl isothiocyanate (**22**) with 2-aminopentiazoline (**24**) afforded a

bicyclic compound, whose structure was not confirmed to be either of the two isomers (**25** and **26**).

The mixture of equimolar amounts of 2-aminothiazole (**15**) and ethoxycarbonyl isothiocyanate (**5**) in ethyl acetate was allowed to stand overnight at room temperature and refluxed for one hour to afford four products (**27**, **28**, **29**, **30**) and thiocyanic acid (**31**). The molecular formula of the compound (**27**) was expressed as $\text{C}_5\text{H}_3\text{N}_3\text{OS}_2$ by the elemental analysis and mass spectrum (MS): $M^+ = 185$, and the infrared (IR) spectrum showed a carbonyl bond at 1680 cm^{-1} and a double bond at 1645 cm^{-1} . The nuclear magnetic resonance (NMR) spectrum consisted of a pair of doublets at 2.70 and 1.90τ (two ring protons, $J = 5.0\text{ Hz}$) and a signal approximately at -3.05τ (one amide proton, broad). From these data, the structure of the compound (**27**) was regarded as a condensed ring structure (Chart 1). Gizycki and Oertel²⁰ obtained two carbamates (**36** and **37**) by the alcoholysis of benzothiazolo[3,2-*a*]-s-triazine-2,4-dione (**35**) with ethyl alcohol and sodium ethoxide. According to this method,

the above compound (**27**) was treated with methyl alcohol to afford methyl-N-(2-thiazolyl)-carbamate (**33**) in 80% yield, whose IR and NMR spectrum coincided with those of the sample obtained from 2-aminothiazole and methyl chloroformate (**34**). From this experiment the structure of compound (**27**) was consequently confirmed as thiazolo[3,2-*a*]-s-triazine-4-thio-2-one. Compound (**28**) was regarded as 1:1 reaction adduct of 2-aminothiazole (**15**) and ethoxycarbonyl isothiocyanate (**5**) on the basis of the elemental analysis and spectral data. The NMR spectrum consisted of three methyl protons (triplet, $J = 7.0\text{ Hz}$) at 9.64τ , two methylene protons (quartet, $J = 7.0\text{ Hz}$) at 5.64τ , two ring protons (a pair of doublets, $J = 3.6\text{ Hz}$) at 2.90 and 2.38τ , and two broad protons approximately at 1.62 and -2.46τ . From these data, it was supposed that the possible structure of the addition product was **28** or **38**. However, this compound was heated at 180 – 190° for 20 minutes on an oil bath to afford the thiazolo[3,2-*a*]-s-triazine-2-thio-4-one (**32**). The IR spectrum of the compound (**32**) showed an amide group at 3150 , 1755 , and 1740 cm^{-1} [$-\text{C}(\text{S})\text{NHC}(\text{O})-$], and the NMR spectrum con-

20) U.V. Gizycki and G. Oertel., *Angew. Chem. internal. Edit.* **7**, 380 (1968).

sisted of ring protons (a pair of doublets, $J=5.0$ Hz) at 2.56 and 2.14 τ , and one broad proton approximately at -2.56 τ . From this experiment, the structure of the compound (**28**) was consequently confirmed as N-ethoxycarbonyl-N'-(2-thiazolyl)thiourea. The IR spectrum and melting point of ethyl-N-(2-thiazolyl)carbamate (**29**) agreed with those of the authentic compound prepared by the treatment of 2-aminothiazole (**15**) with ethyl chloroformate (**39**).²¹ The IR spectrum of N-ethoxycarbonyl thiocarbamate (**30**) coincided with that of the sample obtained by the addition reaction of ethoxycarbonyl isothiocyanate (**5**) with ethyl alcohol. Thiocyanic acid (**31**) formed in the reaction of **15** and **5** was ascertained by the color reaction with ferric chloride.

Chart 1

Other alkoxy carbonyl isothiocyanates (methoxy-, *n*-propoxy-, isopropoxy-, *n*-butoxy-, and isobutoxy carbonyl isothiocyanate) reacted with 2-aminothiazole (**15**) under similar reaction conditions to those of **15** and ethoxycarbonyl isothiocyanate (**5**) to give five products,

21) U.S.A. patent 2850503 (Sept. 2, 1958).

namely N-alkoxycarbonyl-N'-(2-thiazolyl)thioureas (A), alkyl-N-(2-thiazolyl)carbamates (B), the cyclic compound (27), alkyl alkoxycarbonyl thiocarbamates (C) and thiocyanic acid (31) in each case. However, in the case of phenoxycarbonyl isothiocyanate (59), the corresponding 1:1 adduct of 59 and 15 could not be obtained, but thiazolo[3,2-*a*]-s-triazine-2-thio-4-one

Chart 2

(32) was isolated, besides the cyclic compound (27), phenyl-N-(2-thiazolyl)carbamate (60) and phenol. Seemingly the postulated 1:1 adduct (61) cyclized easily to 32 by the elimination of phenol, and the phenol was unreactive with isothiocyanates to form the addition product (62).

Experimental⁽²²⁾

Reactants—Alkoxy- and phenoxycarbonyl isothiocyanates were prepared according to published papers.⁷⁻⁹⁾

General Method for Reaction of Alkoxycarbonyl Isothiocyanates and 2-Aminothiazole—To a solution of 2-aminothiazole (0.01 mole) in AcOEt (30 ml), a solution of alkoxycarbonyl isothiocyanates in AcOEt (20 ml) was added dropwise at 0–5°, and the mixture was allowed to stand overnight. After the reaction solution was refluxed for 1 hr, the reaction mixture was washed with aqueous NaHCO₃ and H₂O, and dried over anhyd. Na₂SO₄. After removal of the solvent under reduced pressure, the residue was eluted with AcOEt–benzene on silica gel, and the isolated compounds were refined by recrystallization or distillation.

Reaction of Ethoxycarbonyl Isothiocyanate (5) with 2-Aminothiazole (15)—Ethoxycarbonyl isothiocyanate (1.31 g) was treated with 2-aminothiazole (1.0 g) to afford four compounds (27, 28, 29, and 30). Thiazolo[3,2-*a*]-s-triazine-4-thio-2-one (27), 0.55 g, pale yellow needles from acetone, mp 268–270° (dec). *Anal.* Calcd. for C₅H₃ON₃S₂: C, 32.44; H, 1.63; N, 22.70; S, 34.50. UV $\lambda_{\text{max}}^{\text{EtOH}}$ m μ (ϵ): 228.5 (9800), 260 (17900), 305 (11000). Isopropyl N-(2-thiazolyl)carbamate (49), 0.16 g, colorless needles from *n*-hexane, mp 127–128°. *Anal.* Calcd. for C₇H₁₀N₂O₂S: C, 45.16; H, 5.41; N, 15.05; S, 17.19. Found: C, 45.24; H, 5.56; N, 15.13; S, 17.38. IR $\nu_{\text{max}}^{\text{Nujol}}$ cm⁻¹: 3200 (NH), 1740 (>C=O). NMR (CDCl₃) τ (J =Hz): 8.58 (6H, d., J =7.0), 4.71 (1H, q., q., J_1 = J_2 =7.0), 2.88 (1H, d., J =4.0), 2.35 (1H, d., J =4.0), ca. -3.33 (1H). UV $\lambda_{\text{max}}^{\text{EtOH}}$ m μ (ϵ): 256 (9400). Isopropyl N-isopropoxycarbonyl thiocarbamate (50), 0.07 g, pale yellow oil, 103–115°/0.6 mmHg (bath temp.). *Anal.* Calcd. for C₈H₁₅N₃O₃S: C, 46.82; H, 7.37; N, 6.83; S, 15.59. Found: C, 46.67; H, 7.50; N, 6.99; S, 15.75. IR $\nu_{\text{max}}^{\text{Nujol}}$ cm⁻¹: 3280 (NH), 1773 (>C=O). NMR (CDCl₃) τ (J =Hz): 8.90 (3H, d., J =7.0), 8.82 (3H, d., J =7.0), 5.01 (1H, q., q., J_1 = J_2 =7.0), 4.37 (1H, q., q., J_1 = J_2 =7.0), ca. 1.83 (1H). UV $\lambda_{\text{max}}^{\text{EtOH}}$ m μ (ϵ): 255 (13700).

Reaction of *n*-Butoxycarbonyl Isothiocyanate (51) and 2-Aminothiazole (15)—*n*-Butoxycarbonyl isothiocyanate (1.75 g) was reacted with 2-aminothiazole (1.0 g) to afford three compounds (52, 53, and 54) besides (27) (0.27 g). N-*n*-Butoxycarbonyl-N'-(2-thiazolyl)thiourea (52), 1.40 g, colorless needles from ethyl acetate, mp 115–116° (dec). *Anal.* Calcd. for C₉H₁₃O₂N₃S₂: C, 41.70; H, 5.06; N, 16.21; S, 24.68. Found: C, 41.76; H, 5.19; N, 16.41; S, 24.55. IR $\nu_{\text{max}}^{\text{Nujol}}$ cm⁻¹: 3150 (NH), 1730 (>C=O). NMR (CDCl₃) τ (J =Hz): 9.06 (3H, t., J =6.0), 7.94–9.02 (4H, m.), 5.50 (2H, t., J =6.0), 3.00 (1H, d., J =4.0), 2.22 (1H, d., J =4.0), ca. 1.30 (1H, m.), ca. -2.95 (1H, m.). UV $\lambda_{\text{max}}^{\text{EtOH}}$ m μ (ϵ): 229 (9300), 259.5 (16900), 306 (11100). *n*-Butyl N-(2-thiazolyl)carbamate (53), 0.35 g, colorless needles from *n*-hexane, mp 122–124°. *Anal.*

Calcd. for $C_8H_{12}O_2N_2S$: C, 47.99; H, 6.04; N, 13.99; S, 15.97. Found: C, 47.72; H, 6.23; N, 14.06; S, 16.08. IR $\nu_{\max}^{\text{Nujol}}$ cm^{-1} : 3170 (NH), 1725 ($>C=O$). NMR ($CDCl_3$) τ ($J=\text{Hz}$): 8.98 (3H, t., $J=6.8$), 8.82—7.86 (4H, m.), 5.58 (2H, t., $J=7.0$), 2.86 (1H, d., $J=4.0$), 2.34 (1H, d., $J=4.0$), ca. -3.30 (1H). UV $\lambda_{\max}^{\text{EtOH}}$ $m\mu$ (ϵ): 256 (9400). *n*-Butyl *N*-*n*-Butoxycarbonyl thiocarbamate (54), 0.08 g, pale yellow oil, bp 130—135°/1.0 mmHg (bath temp.). Anal. Calcd. for $C_{10}H_{18}NO_3S$: C, 51.49; H, 8.21; N, 6.01; S, 13.72. Found: C, 51.59; H, 8.30; N, 6.06; S, 13.62. IR $\nu_{\max}^{\text{Liq.}}$ cm^{-1} : 3250 (NH), 1780 ($>C=O$). NMR ($CDCl_3$) τ ($J=\text{Hz}$): 9.06 (3H, t., $J=6.0$), 9.04 (3H, t., $J=6.0$), 9.04—7.90 (8H, m.), 5.84 (2H, t., $J=6.0$), 5.46 (2H, t., $J=6.0$), ca. 1.62 (1H). UV $\lambda_{\max}^{\text{EtOH}}$ $m\mu$ (ϵ): 254 (13500).

Reaction of Isobutoxycarbonyl Isothiocyanate (55) and 2-Aminothiazole (15)—Isobutoxycarbonyl isothiocyanate (1.75 g) was reacted with 2-aminothiazole (1.0 g) to afford three compounds (56, 57, and 58) besides (27) (0.48g). *N*-Isobutoxycarbonyl-*N'*-(2-thiazolyl)thiourea (56), 1.20 g, colorless needles from *n*-hexane-benzene, mp 135° (decomp.). Anal. Calcd. for $C_9H_{13}O_2N_3S_2$: C, 41.70; H, 5.06; N, 16.21; S, 24.68. Found: C, 41.70; H, 5.22; N, 16.12; S, 24.44. IR $\nu_{\max}^{\text{Nujol}}$ cm^{-1} : 3150 (NH), 1730 ($>C=O$). NMR ($CDCl_3$) τ ($J=\text{Hz}$): 9.05 (6H, d., $J=7.0$), 8.00 (1H, q., q., t., $J_1=J_2=J_3=7.0$), 5.95 (2H, d., $J=7.0$), 2.96 (1H, d., $J=4.0$), ca. 1.40 (1H), ca. -2.88 (1H). UV $\lambda_{\max}^{\text{EtOH}}$ $m\mu$ (ϵ): 229 (9600), 260 (17400), 305 (11500). Isobutyl *N*-(2-thiazolyl)carbamate (57), 0.3 g, colorless needles from *n*-hexane, mp 108—109°. Anal. Calcd. for $C_8H_{12}O_2N_2S$: C, 47.99; H, 6.04; N, 13.99; S, 15.97. Found: C, 47.75; H, 6.27; N, 13.97; S, 16.03. IR $\nu_{\max}^{\text{Nujol}}$ cm^{-1} : 3200 (NH), 1730 ($>C=O$). NMR ($CDCl_3$) τ ($J=\text{Hz}$): 8.95 (6H, d., $J=7.0$), 7.88 (1H, q., q., t., $J_1=J_2=J_3=7.0$), 5.77 (2H, d., $J=7.0$), 2.85 (1H, d., $J=4.0$), 2.30 (1H, d., $J=4.0$), ca. -3.38 (1H). UV $\lambda_{\max}^{\text{EtOH}}$ $m\mu$ (ϵ): 256 (9200). Isobutyl *N*-isobutoxycarbonyl thiocarbamate (58), 0.15 g, pale yellow oil, bp 130—135°/1.0 mmHg (bath temp.). Anal. Calcd. for $C_{10}H_{18}O_3NS$: C, 51.49; H, 8.21; N, 6.01; S, 13.72. Found: C, 51.70; H, 8.61; N, 6.29; S, 13.69. IR $\nu_{\max}^{\text{Liq.}}$ cm^{-1} : 3250 (NH), 1770 ($>C=O$). NMR ($CDCl_3$) τ ($J=\text{Hz}$): 9.03 (6H, d., $J=6.5$), 8.94 (6H, d., $J=6.5$), 8.16 (1H, q., q., t., $J_1=J_2=J_3=6.5$), 7.87 (1H, q., q., t., $J_1=J_2=J_3=6.5$), 6.04 (2H, d., $J=6.5$), 5.68 (2H, d., $J=6.5$), ca. 1.46 (1H). UV $\lambda_{\max}^{\text{EtOH}}$ $m\mu$ (ϵ): 254 (13900).

Reaction of Phenoxycarbonyl Isothiocyanate (59) and 2-Aminothiazole (15)—Phenoxycarbonyl isothiocyanate (1.79 g) was reacted with 2-aminothiazole (1.0 g) to afford compound (60) besides (27) (0.94 g), (32) (0.4 g) and phenol (0.82 g), whose IR spectrum agreed with that of the authentic sample. Phenyl *N*-(2-thiazolyl)carbamate (60), 0.43 g, colorless needles from *n*-hexane, mp 178—180°. Anal. Calcd. for $C_{10}H_8O_2N_2S$: C, 54.55; H, 3.66; N, 21.72; S, 14.53. Found: C, 54.84; H, 3.90; N, 21.91; S, 14.33. IR $\nu_{\max}^{\text{Nujol}}$ cm^{-1} : 3170 (NH), 1740 ($>C=O$). NMR ($CDCl_3$) τ ($J=\text{Hz}$): 2.82 (1H, d., $J=4.0$), 2.20 (1H, d., $J=4.0$), 2.80—2.20 (5H, m.), ca. -3.96 (1H).

Acknowledgement We are grateful to Dr. G. Kuwata, Manager of this Laboratories. We are also indebted to members of the Section of Physical Chemistry for the elemental analyses and determination of absorption spectra.
