Synthetic Antimicrobials. II.\textsuperscript{10} Synthesis of Pyrazolo[1,5-α]pyridine Derivatives. (I)

Seigo Suzue,\textsuperscript{2a} Masaaki Hirobe, and Toshihiko Okamoto

Faculty of Pharmaceutical Science, University of Tokyo\textsuperscript{3}

(Received January 22, 1973)

2-Alkyl-3-acyloxy pyrazolo[1,5-α]pyridines (III) were prepared by refluxing 1-amino-2-hydroxy methylpyridinium chloride (Ia) in excess acetyl anhydride in the presence of a base. III were converted into 2-alkyl-3-hydroxy derivatives (IVa—f) by acid hydrolysis. Ia was refluxed with ethyl orthoformate in acetic acid containing sodium acetate to give 3-hydroxy derivative (IVg).

Reaction of Ia with benzoyl chloride in H\textsubscript{2}O-K\textsubscript{2}CO\textsubscript{3} gave mainly O,N-dibenzoyl ylide (VIIa) and 2-phenyl-3-benzyloxy pyrazolo[1,5-α]pyridine (IXa). Pyrolysis of VIIa gave 2-phenyl-3-hydroxy derivative (VIIIa), which was also obtained from 1-benzimidazo-2-hydroxymethylpyridine (VIA) by treatment with H\textsubscript{2}SO\textsubscript{4}, followed by alkali treatment. Further the compound (VIIIa) was prepared by the reaction of 1-benzimidazo-2-picoline (XVIa) with I in pyridine. Analogously various 2-substituted-3-hydroxy derivatives (VIIIb—I and IVa) were obtained.

1-Anilinothiocarbonylimino-2-hydroxymethylpyridine (XIXa) was converted into cyclic pyridinium salt (XXa) by treating with H\textsubscript{2}SO\textsubscript{4}, and XXa was treated with K\textsubscript{2}CO\textsubscript{3} to give 2,2'-dianilino pyrazolo[1,5-α]pyridine-3,3'-disulfide (XXIIa). XXXIIa was converted into 2-anilino derivative (XXIIIa) by Raney Ni reduction. Analogously 2-benzamido derivative (XXIIIb) was obtained from 1-benzamidothiocarbonylimino-2-hydroxymethylpyridine (XIXa) by the same procedure. 2-Acetamido derivative (XXIX) was obtained by heating pyridine-2-acetamidoxime (XXVII) with acetic anhydride. The compounds (XXIIIa and XXIX) were also converted into the corresponding 3-thiocyanano and 3-nitro derivatives (XXIV, XXV, XXXIIb and XXXIIc).

The tuberculostatic activities of the pyrazolo[1,5-α]pyridine derivatives were also indicated. It has been found that 3-acetoxy-2-methylpyrazolo[1,5-α]pyridine (IIIa), which was obtained during the preparation of 1-acetimidazo-2-acetoxy methylpyridine (II) described in the preceding paper,\textsuperscript{10} had a potent growth inhibitory activity in vitro against mycobacteria. Then an interest in the formation, and chemical and physiological properties of the novel pyrazolo[1,5-α]pyridine derivatives led us to further studies on this ring system.

Concerning the synthesis of pyrazolo[1,5-α]pyridine ring system, Potts, et al.,\textsuperscript{3} recently reported a method by treatment of 2-alkyl-1-aminopyridinium salts with acyl chlorides in about 20% yield, and other earlier procedures were also presented in his report. However, there has been no report regarding the biological activities of the pyrazolo[1,5-α]pyridine derivatives.

The present paper is on the novel synthesis of pyrazolo[1,5-α]pyridine derivatives and their tuberculostatic activities.

Reaction of 1-amino-2-hydroxymethylpyridinium chloride (Ia) with acetic anhydride mainly provided II together with a small amount of IIIa. When the reaction was carried out in the presence of a basic substance, such as sodium acetate and pyridine, the reaction afforded IIIa in a good yield.

1) a) Part I: S. Suzue, M. Hirobe, and T. Okamoto, Yakugaku Zasshi, 93, 1331 (1973); b) A part of this work was presented at the 89th Annual Meeting of the Pharmaceutical Society of Japan, Nagoya, April 1969.
2) Location: Hongo, 7-3-1, Bunkyo-ku, Tokyo; a) Present address: Kyorin Chemical Laboratory, Ushima, 1-3, Kitaku, Tokyo.
Chart 1

Chart 2
In the same manner, 3-acyloxy-2-alkyl derivatives (IIIb, c, e, and f) were obtained in a moderate yield (about 50%) as shown in Chart 1. These compounds (III) were readily hydrolyzed to 2-alkyl-3-hydroxy derivatives (IVa—f) on warming in aqueous hydrochloric acid solution. Trifluoromethyl derivative (IIIe) underwent deacetylation to IVed during the purification by silica gel chromatography. 3-Hydroxy derivative (IVg) unsubstituted in the 2-position was also prepared in 40% yield by refluxing Ia with ethyl orthoformate in acetic acid containing sodium acetate. Further, IVa was converted into 3-methoxy derivative (Va) by treatment with dimethyl sulfate in aqueous sodium hydroxide solution. The compounds (Vb and c) were also prepared from the corresponding 3-hydroxy derivatives (IVe and g) by treatment with acid anhydrides.

**Table I. Reaction of Ia with Benzoyl Chloride in H₂O—K₂CO₃**

On the other hand, when Ia was allowed to react with 1.6 moles of benzoyl chloride in aqueous potassium carbonate solution at room temperature, four products were separated by column chromatography over alumina. The first product was found to be 1-benzimidazo-2-hydroxymethylpyridine (Vf) by elemental analysis, nuclear magnetic resonance (NMR) spectrum, and infrared (IR) spectrum. Vf showed a characteristic absorption band at 1520 cm⁻¹ as was seen in the case of 1-acyliminopyridine derivatives⁴ and at 3200—2600 cm⁻¹ attributed to a hydroxyl group in its IR spectrum. The second product was proved to be 1-benzimidazo-2-benzoyloxymethylpyridine (VIIa) on the basis of analytical data and IR spectrum, which exhibited carbonyl band of the benzoyl group on the ylide-type nitrogen at 1555 cm⁻¹ and ester band at 1730, 1290, and 1125 cm⁻¹. The third product (VIIIa) showed no carbonyl band but the hydroxyl absorption in the region of 3000 cm⁻¹ in its IR spectrum.

NMR spectrum of its methyl ether (Xa), prepared by treating VIIa with dimethyl sulfate in aqueous sodium hydroxide solution, was consistent with that of 3-methoxy-2-phenylpyrazolo[1,5-a]pyridine (Xa). On the basis of above data together with elemental analyses, VIIa was culminated to be 3-hydroxy-2-phenylpyrazolo[1,5-a]pyridine. The fourth product, which gave VIIa and benzoic acid on hydrolysis, was proved to be 3-benzyloxy-2-phenyl derivative (IXa). The ratio of the formation of these products was influenced by the amount of benzoyl chloride as shown in Table I.

Analogous to the above reaction, Ia was allowed to react with 3 moles of various substituted benzoyl chlorides to produce O,N-diacyl ylides (VIIe—j) and pyrazolo[1,5-a]pyridine derivatives (IXe—j), and the results are summarized in Table II.

The data in Table I suggest that an intermediate in the course of the cyclization to VIIa or IXa would be not VIIa but VIA, since the rate of formation of VIIa did not decrease with increased quantity of benzoyl chloride. In order to confirm this suggestion, the following reaction was carried out. First, VIA was treated with benzoyl chloride under the similar reaction condition as described in the reaction of Ia with benzoyl chloride to give the cyclization products, and VIIa and IXa were obtained. The same treatment of VIIa did not give the cyclization product and the starting material was recovered. Further, in order to confirm the introduction of the phenyl group at 2-position of IXa, VIA was reacted with 2.2 moles of \(p\)-nitrobenzoyl chloride under the same condition, and three kinds of ylide-type compounds (VIIb—d) and two kinds of pyrazolo[1,5-a]pyridine derivatives (VIIa and IXb) were obtained as shown in Chart 2. These results indicate the probable course of the cyclization as shown in Chart 3.
The primarily formed N-benzoyl-ylide (VIa) would be able to react further with benzoyl chloride to produce VIIa, XII, and XIII. The compound (VIIa) would not be undergone further conversion under such condition, but might give N,N-dibenzoylimino derivative (XI), which would be hydrolyzed easily to VIIa again, because VIIc was obtained in the reaction of VIa with p-nitrobenzoyl chloride. The compound (XII) might be convertible into VIIa as the result of N→O rearrangement of the benzoyl group, as supported by the formation of VIIId in the above reaction. The compound (XIII) would collapse very easily to a six-membered cyclic pyridinium salt (XIV), which would be deprotonated to XV under alkaline condition. The compound (XV), having 12π ring system, might be recyclized to a more stable VIIIa possessing a 10π ring system via an intermediate (XVI) as shown by arrows. The possibility of the formation of VIIIa from XIII via the anhydro base (XIII') was also considered, but it was difficult to support this possibility, since VIIa which would have a tendency to form the corresponding anhydro base more easily than VIa, could not be converted into IXa on treatment with benzoyl chloride in aqueous potassium carbonate solution which was the identical condition as that in the reaction of VIa and benzoyl chloride to form VIIIa.

Next, on the basis of the above assumption, an attempt was made to obtain 3-hydroxy-pyrazolo[1,5-a]pyridine derivatives from a substance capable of being converted into the intermediate (XV) via cyclic pyridinium derivative (XIV) under a suitable condition and three successful routes were found as shown in Chart 4.
First, VIIa was heated at 190° for 15 min to afford VIIIa and benzoic acid in approximately equal amounts (80%), together with a small amount (2.5%) of IXa. VIIa was then treated with sulfuric acid, followed by alkali treatment, to obtain VIIIa in 71% yield. The same compound (VIIIa) was obtained in 26% yield by refluxing 1-benzimido-2-picoline (XVIIa) with an equimolar amount of iodine in pyridine. In a similar manner, various 3-hydroxy-pyrazolo[1,5-a]pyridine derivatives (VIIIe—l, IVa) were obtained and converted further into the corresponding 3-acetoxy derivatives (XVIIIe—l) by treating with acetic anhydride for antimicrobial evaluation as shown in Chart 4.

The scope of the cyclization method was extended to 1-thiocarbonylimino-2-hydroxy-methylpyridine derivatives. 1-Anilinothiocarbonylimino-2-hydroxymethylpyridine (XIXa), which was prepared from Ia and phenyl isothiocyanate, was treated with sulfuric acid at room temperature and the resulting mixture was poured into ice water. Crystalline product that separated out was proved to be the cyclic pyridinium salt, 2-anilinopyridinium[1,2-d]-1,3,4-thiadiazine hydrogensulfate (XXa), which was hitherto postulated as an intermediate during the formation of pyrazolo[1,5-a]pyridines in our cyclization methods. Its structure...
was proved by IR and NMR spectra, and from elementary analysis. The NMR spectrum of XXa (in DMSO-$d_6$) revealed a broad singlet at 5.30 $\tau$ (2H) due to methylene group, a broad singlet at $-0.98 \tau$ (1H), which disappeared by deuterium oxide treatment, assignable to the NH group, a multiplet at 0.8 $\tau$ (1H) ascribable to C-6 proton of pyridine ring, and signals of the aromatic protons at 8.35–3.00 $\tau$ (8H). The IR spectrum showed the absorption bands at 3400–3000 cm$^{-1}$ attributed to the salts, at 1530 cm$^{-1}$ due to C=N group, and no thiocarbonyl group which existed in the spectrum of XIXa at 1440 cm$^{-1}$. When XXa was treated with alkali in water, a disulfide (XXIIa), which would result from the corresponding thiol (XXIa), was obtained in 88% yield. The structure of XXIIa was confirmed by elemental analyses and mass spectral data, which exhibited a weak molecular ion peak ($m/e=536$) and a strong (M/2) peak (268), and others. On treatment with Raney nickel in acetone, XXIIa was converted into 2-anilinopyrazolo[1,5-a]pyridine (XXIIIa), whose NMR spectrum indicated the C-3 proton at 2.73 $\tau$ (1H) as a singlet and others (see Table V).

In a similar manner, 1-benzamidothiocarbonylimino-2-hydroxymethylpyridine (XIXb), which was obtained from Ia and benzoyl isothiocyanate, was converted into the corresponding disulfide (XXIIb) without isolation of cyclic pyridinium salt (XXb) as described in the experimental part. XXIIb was also converted into 2-benzamidopyrazolo[1,5-a]pyridine (XXIIIb) by Raney nickel reduction.

Thiocyanation of XXIIIa was effected by the usual method of reacting XXIIIa with ammonium thiocyanate and bromine in acetic acid to afford 3-mono and 3,4'-di-thiocyanato derivatives (XXIV and XXV).

On the other hand, it was found that 2-aminopyrazolo[1,5-a]pyridine derivatives could be obtained from pyridine-2-acetamidoxime (XXVII) by treatment with acetic anhydride. Namely, the compound (XXVII), prepared from pyridine-2-acetonitrile (XXVI) and hydroxylamine, was treated with excess acetic anhydride at 100° for 30 min and the reaction products were separated by chromatography on alumina. 2-Acetamidopyrazolo[1,5-a]pyridine (XXIX), 5-methyl-3-(2-pyridylmethyl)-1,2,4-oxadiazole (XXVIII), and 2-acetamido-3-ace-
tylpazolo[1,5-a]pyridine (XXX) were obtained respectively in 29.7%, 32.9%, and 1.3% yield. Besides these products, traces of three kinds of products were separated as colorless needles having the molecular formula of C_{11}H_{16}O_{2}N_{3} (mp 118—119°C), pale yellow needles of C_{11}H_{15}O_{2}N_{3} (mp 121°C), and colorless needles of C_{11}H_{14}O_{2}N_{3} (mp 149—150°C), structures of which are under investigation.

Acid hydrolysis of XXIX gave 2-amino derivative (XXXII), which was converted into 2-benzamido derivative on treatment with benzoyl chloride, and it was identical with the compound (XXIIIb) obtained from XXIIb by IR spectral comparison and mixed mp determination. When the reaction time was prolonged to 24 hr in the reaction of XXVII and acetic anhydride, the yield of XXIX was increased to 42% and that of XXVIII decreased to 6.2%. This suggested a possibility for the formation of XXIX from XXVIII, and it was found that the oxadiazole derivative (XXVIII) was also convertible into pyrazolo[1,5-a]pyridines (XXIX and XXX) by refluxing in acetic anhydride. The structure of XXX was confirmed by the following reaction, together with its spectroscopic data and elemental analysis. The bromination of pyrazolo[1,5-a]pyridine derivative has been found to occur in the 3-position\(^5\) and that of XXIX in acetic acid also took place at the 3-position to give 3-bromo derivative (XXXIa), whose structure was also evident from its NMR spectrum. On the other hand, since it has also been known that acetyl group in the 3-position of pyrazolo[1,5-a]pyridine derivative was easily replaced by an electrophilic reagents such as bromine,\(^6\) the bromination of XXX was carried out and the resulting 3-bromo derivative (XXXIa) was identical with that obtained from XXIX as described above by IR spectral comparison and mixed mp determination.

Nitration and thiocyanation of XXIX were also carried out by the usual method to obtain 3-nitro and 3-thiocyanato derivatives (XXXIb and XXXIc) in a good yield.

The pyrazolo[1,5-a]pyridines obtained in the present work are summarized in Table IV. The concentration of these compounds inhibiting the growth of Mycobacterium tuberculosis Aoyama B strain was determined at 37°C for 14 days in Dubos medium by Ushiyma and others of the Microbial Research Room in Kyorin Chemical Laboratory and the results are given in Table IV. Ethionamide used as the control inhibited the growth of the bacteria at 10 μg/ml, while 2-(substituted phenyl)-3-hydroxyrazolo[1,5-a]pyridine derivatives (VIIIe—

$^a$ A: Determined in CDCl$_3$ with TMS as internal standard, B: Determined in d$_4$-DMSO with TMS as internal standard, C: Determined in $d_6$-DMSO with TMS as internal standard. Data of Compd. No Xe, XXIIa, XXIIIa, XXIIb, XXIIIb, and XXXII were obtained using a 60 MHz and others were with 100 MHz.
j) were effective at equal or lower doses. Among the compounds (VIIIe—j), 2-(m-fluoro- or
-iodophenyl)-3-hydroxy derivative was the strongest, being about 10 times stronger than
Ethionamide. Among the series of 2-alkyl-3-hydroxy derivatives, 2-methyl and 2-ethyl
derivatives (IVA, B, E, f) showed the same activity as that of Ethionamide. 3-Acetoxy de-
rivatives showed activity nearly equal to that of the corresponding 3-hydroxy derivatives.
3-Thiocyanato derivatives (XXIV and XXXIc) also showed potent activity.

Experimental

All melting points are uncorrected. IR spectra were taken on a Nihon Bunko Model IR-S and Model
DS-301. NMR spectra were measured on a Nihon Denki C60H and JNM-4H-100. Analytical data of the
pyrazolo[1,5-a]pyridines are summarized in Table IV and those of VIa—j are shown in Table III.

3-Acetoxy-2-methylpyrazolo[1,5-a]pyridine (IIia) and Its 5-Alkoy Derivatives (IIIe, f)—A mixture of
3.20 g (0.02 mole) of Ia, 2.46 g (0.03 mole) of AcONa, and 50 ml of AcO in refluxed for 5 h. After
removal of the excess AcO under reduced pressure on a water bath using a rotary evaporator, the residual
mass was treated with 30 ml of H2O, basified with K2CO3, and extracted with CH2Cl2. The CH2Cl2
extract was washed with water, dried (Na2SO4), and distilled to give 3.38 g (89%) of IIIa as a colorless oil, bp 126—
128° (3 mmHg). IR νmax cm⁻¹: 1765 (ester). It readily formed a picrate, which was recrystallized from
EtOH as yellow needles, mp 152—153°.

The same treatment of Ib or Ic as for Ia gave a crude product, which was chromatographed on silica
gel using ether as eluent without distillation to give IIIe or IIIf. Experimental data are shown in Table IV.

2-Ethyl- or Propyl-3-propionylxox- or Butyroxy-pyrazolo[1,5-a]pyridine (IIIb or IIIc)—A mixture of
1.60 g (0.01 mole) of Ia, 16 ml of propionic anhydride (or butyric anhydride), and 1.4 ml of pyridine was
heated on an oil bath (140—145°) for 5 h, and then the excess reagent were removed under a reduced pressure.
The dark residue was taken up in CH2Cl2 and chromatographed on silica gel. The CH2Cl2 eluate
yielded a pale brown crystal, which was recrystallized from hexane to colorless needles (IIIb), mp 49°,
weighing 1.149 g (53%). IR νmax cm⁻¹: 1760 (ester). When butyric anhydride was used, IIIc was obtained as
a colorless oil (1.296 g, 52.3%). IR νmax cm⁻¹: 1770 (ester). The picrate of IIIc was recrystallized from
EtOH as yellow needles, mp 106—107°.

3-Hydroxy-2-trifluoromethylpyrazolo[1,5-a]pyridine (IVd)—To a cooled solution of 1.60 g Ia in 20 ml of
trifluoroacetic anhydride 2 ml of pyridine was added dropwise with stirring and the mixture was refluxed for
7 h on a water bath (80°). After removal of the excess reagents under a reduced pressure, the crude
product obtained was chromatographed on silica gel using CH2Cl2 as eluent. IVd was obtained and recrystal-
лизated from MeOH—H2O as colorless rods, mp 184°. Yield, 0.511 g (25%).

2-Alkyl-3-hydroxyazopyrazolo[1,5-a]pyridine (IVa—c) and Its 5-Alkoy Derivatives (IVe, f)—A solution of
III (or Vb) (0.01 mole) in 10% HCl (20 ml) was heated on a water bath for 1 hr. The solution was basified with conc.
NH4OH to give a crystalline product, which was recrystallized from the solvent shown in Table IV.

3-Acetoxyazopyrazolo[1,5-a]pyridine (Vb)—A mixture of 1.6 g of Ia, 25 ml of AcOH, 1.6 g of ACONa,
and 2.0 g of ethyl orthoformate was refluxed for 5 hr, and the excess reagents were removed under a reduced pressure.
To the resulting residue was added 20 ml of AcO and the mixture was allowed to stand overnight.
After removal of the excess AcO under a reduced pressure, the residual dark oil was chromatographed on alumina using
CH2Cl2 as eluent. Vb was obtained as a colorless oil (0.700 g). IR νmax cm⁻¹: 1750 (ester).
It gave a picrate, which was recrystallized from EtOH as yellow needles, mp 145—146°.

Reaction of Ia with BzCl in Aqueous K2CO3—To a solution of 1.00 g of Ia in 5 ml of H2O containing
1.38 g of K2CO3, a solution of 1.40 g of BzCl in 10 ml of CH2Cl2 was added dropwise at 5—10° with stirring.
The stirring was continued for 1 hr at the same temperature and then for further 3 hr at room temperature.
The mixture was extracted with CH2Cl2 layer was dried over anhyd. Na2SO4, and evaporated to dryness.
The residue was chromatographed on alumina using CH2Cl2 as eluent.

First Fraction: Recrystallized from MeOH gave 73 mg of 3-benzoyloxy-2-phenylpyrazolo[1,5-a]pyridine
(IXa) as colorless needles, mp 125—126°. IR νmax cm⁻¹: 1755 (ester).

Second Fraction: Recrystallization from MeOH—H2O afforded 41 mg of 3-hydroxy-2-phenylpyrazolo-
[1,5-a]pyridine (VIIa) as colorless needles, mp 215—217° (decayed).

Third Fraction: Recrystallization from AcOEt gave 0.184 g of 1-benzimido-2-benzoyloxymethylpyridine
(VIIa) as colorless needles, mp 146°. NMR ν in CDCl3: 4.23 (2H, singlet, -CH2-).

Fourth Fraction: Recrystallization from MeOH—AcOEt gave 0.174 g of 1-benzimido-2-benzoylaminopyridine
(VIa as colorless plates, mp 178—179°. IR νmax cm⁻¹: 3200—2600 (OH), 1520 (-CNO-).
NMR ν in D2O: 5.39 (2H, singlet, -CH2-). Anal. Calc'd, for C15H13N2O4: C, 68.41; H, 5.30; N, 12.27. Found: C,
68.29; H, 5.42; N, 12.36.

The data of the same reaction of Ia with another quantities of BzCl are summarized in Table I. In
the same manner, Ia was allowed to react with three-fold moles of various substituted benzoyl chloride in

NII-Electronic Library Service
aq. $K_2CO_3$ and the results are summarized in Table II. Analytical data of VIa—j are summarized in Table III.

3-Methoxy-2-phenylpyrazolo[1,5-a]pyridine (Xa) — To a solution of 60 mg of VIIa in 15 ml of aq. 5% NaOH was added 1 ml of $Me_2SO_4$ and the mixture was stirred for 3 hr. The mixture was extracted with $CH_2Cl_2$, the extract was dried over anhyd. $Na_2SO_4$, and evaporated to give a crude product, which was recrystallized from hexane to 48 mg (75%) of Xa as pale grey rods, mp 80°.

By the same way, 2-(m-bromophenyl or p-nitrophenyl)-3-methoxypyrazolo[1,5-a]pyridine (Xb or Xc) was obtained from the corresponding 3-hydroxy derivative.

Reaction of VIa with p-Nitrobenzoyl Chloride in aq. $K_2CO_3$ — To a mixture of 366 mg of VIa and 484 mg of $K_2CO_3$ in 5 ml of $H_2O$, a solution of 650 mg of p-nitrobenzoyl chloride in 5 ml of $CHCl_3$ was added in room temperature with stirring. After few minutes, red needles began to separate. The stirring was continued for 6 hr and, after standing overnight, the red crystals were collected by filtration and the filtrate was extracted with $CHCl_3$. The $CHCl_3$ layer, after being dried over $Na_2SO_4$, was evaporated to give a crude product, which was triturated with AcOEt. The insoluble red crystals were combined with those obtained from the reaction mixture and recrystallized from AcOEt to 94 mg of IXa as red needles, mp 248—249°.
The AcOEt layer used in the trituration was evaporated to give a crude mass, which was chromatographed over alumina with $CH_2Cl_2$.

First Fraction: 45 mg of IXa.
Second Fraction: Recrystallization from MeOH—$H_2O$ gave 4 mg of VIIa, mp 215°.
Third Fraction: Recrystallization from AcOEt gave 23 mg of 2-benzoxylomethyl-1-(p-nitrobenzimidazo)-pyridine (VIIb) as pale yellow needles, mp 185—185°. $IR v_{max} cm^{-1}$: 1730 (ester), 1580 (NCO-). VIIb (100 mg) was treated with a solution of $CH_2Cl_2$ (1 ml), MeOH (1 ml), and aq. 28% $NH_4OH$ (0.5 ml) at room temperature and gave 85 mg of 2-hydroxymethyl-1-(p-nitrobenzimidazo)pyridine as colorless needles mp 205—206° (from MeOH), and methyl benzoate (68 mg). Anal. Caled. for $C_{12}H_9O_2N_2$: C, 57.14; H, 4.06; N, 15.38. Found: C, 56.89; H, 4.29; N, 15.13. $IR v_{max} cm^{-1}$: 3200 (br, OH), 1570 (NCO-).

Fourth Fraction: Recrystallization from MeOH gave 31 mg of 1-(p-nitrobenzimidazo)-2-(p-nitrobenzoyloxymethyl)pyridine (VIIc) as colorless needles, mp 192°. $IR v_{max} cm^{-1}$: 1740 (ester), 1580 (NCO-).

Fifth Fraction: Recrystallization from MeOH gave 273 mg of 1-benzoimidazo-2-(p-nitrobenzoyloxymethyl)pyridine (VIIId) as pale yellow needles, mp 168°. $IR v_{max} cm^{-1}$: 1735 (ester), 1600 (NCO-).

Pyrolysis of VIIa, e—j — The following method illustrates the general procedure for the products summarized in Table IV.

VIIa (0.337 g) was heated at 190—195° under a reduced pressure for 15 min, during which time benzoic acid (8 mg) sublimed. When cooled, the reaction mixture was triturated with $CH_2Cl_2$ (2 ml) and the insoluble material (VIIa, 102 mg) was collected. The $CH_2Cl_2$ layer was washed with 2.8% $NH_4OH$ and evaporated to leave a crystalline mass, which was chromatographed over silica gel with $CH_2Cl_2$ to give 8.9 mg of IXa as the first fraction and 68 mg of VIIa as the second fraction. Total yield of VIIa, 170 mg. The aq. $NH_4OH$ layer, on evaporation after drying over $Na_2SO_4$, gave 90 mg of benzoic acid. The total yield of benzoic acid, 98 mg.

In the same way, VIIc—j were obtained as shown in Table IV.

VIIIa, k from VIa, k by $H_2SO_4$ Treatment — Ninety-three milligrams of VIa was dissolved in 1 ml of conc. $H_2SO_4$ below 20° with moderate cooling and stirring. After being stirred for 2 hr at room temperature, the mixture was poured on 20 g of brushed ice. The resulting aq. solution, after being basified with $K_2CO_3$, was extracted with $CH_2Cl_2$. The extract was dried ($Na_2SO_4$) and evaporated under a reduced pressure, giving 61 mg of VIIa as colorless needles, mp 215°, on recrystallization from $H_2O$—MeOH. This compound was identical with the product obtained as above by mixed mp determination and IR spectral comparison. In the same way, VIIk was prepared from VIIk in 86% yield.

Reaction of XVIIa—c with I₂ in Pyridine — To a suspension of 0.639 g of XVIIa in 3 ml pyridine, 760 mg of I₂ was added with stirring, refluxed for 5 hr, and the mixture was concentrated under a reduced pressure. The resulting dark mass was triturated with a small amount of CHCl₃ and the insoluble material was recrystallized from MeOH—$H_2O$ to give VIIIa (165 mg) as colorless needles, mp 215°. The material was identical with the sample obtained as above by admixture, thin—layer chromatography (TLC), and IR spectral comparison. In the same manner, 1-acetimidio-2-picoline was reacted and the crude product was chromatographed over alumina with $CH_2Cl_2$ to give IVa in 11.4% yield.

1-Isonicotinoylimino-2-picoline (XVIIb), prepared as will be described later, was converted into 3-hydroxy-2-(pyridin-4-yl)pyrazolo[1,5-a]pyridine (VIII) in the same manner, but the isolation of VIII from the reaction mixture was as follows: The reaction mixture was concentrated under a reduced pressure, excess $AcO$ was added to the dark residue, and the mixture was allowed to stand over night, concentrated, and chromatographed over alumina with $CH_2Cl_2$ to give 3-acetoxy-2-(pyridin-4-yl)pyrazolo[1,5-a]pyridine (XVIII) which was recrystallized from AcOEt—hexane to colorless needles, mp 140—141°. $IR v_{max} cm^{-1}$: 1760 (ester). Yield, 20.6%. XVIII thus obtained was hydrolyzed to VIII in 92% yield in the same manner as described for IVa—c.

1-Isonicotinoylimino-2-picoline (XVIII) — To a solution of 2.3 g of 1-amino-2-picolinium iodide in 10 ml of $H_2O$ containing 3.0 g of $K_2CO_3$, 1.5 g of BrCN was added with stirring at 5—10° and the mixture was stirred
for 8 hr at room temperature. Crystals which separated from the reaction mixture were collected by filtration and recrystallized from AcOEt to 0.798 g of 1-cyanimino-2-picoline as colorless needles, mp 121—122°. Anal. Calcd. for C₂H₄N₂: C, 63.14; H, 5.30; N, 31.56. Found: C, 63.02; H, 5.30; N, 31.41.

A suspension of 1.3 g of 1-cyanimino-2-picoline and 1.50 g of isonicotinic acid in 16 ml of dimethylformamide was heated on a water bath for 2 hr. The suspension became a clear solution, which was heated for further 16 hr and evaporated to dryness. The resulting crystals were extracted with CH₂Cl₂ and the extract was concentrated and chromatographed over alumina using CH₂Cl₂ containing MeOH (5%) as eluent to give 1.150 g of colorless rods, which were recrystallized from AcOEt to colorless rods, mp 146—147°. IR νₑₚₑₑ cm⁻¹: 1585 (NCO). Anal. Calcd. for C₁₂H₁₁O₂N₃: C, 67.59; H, 5.20; N, 19.71. Found: C, 67.51; H, 5.45; N, 19.81

3-Acetoxy-2-substituted Phenylpyrazolo[1,5-α]pyridine (XVIIe—I)—VIIe—I was refluxed with excess Ac₂O for 3 hr and, after removal of the excess Ac₂O, the residue was recrystallized from a suitable solvent as shown in Table IV to give XVIIe—I.

1-Anilinothiocarbonyl-2-hydroxymethylpyridine (XIXa)—To a solution of 1.60 g of Ia in 10 ml of H₂O containing 1.4 g of K₂CO₃ a solution of 1.4 g of phenyl isothiocyanate in 20 ml of CH₂Cl₂ was added and the mixture was stirred for 5 hr at room temperature. The product which separated was collected and recrystallized from MeOH to colorless needles, mp 146—147°. Yield 1.855 g (71.5%). Anal. Calcd. for C₁₂H₁₂O₂N₃S: C, 60.22; H, 5.05; N, 16.29. Found: C, 60.12; H, 5.13; N, 16.28.

1-Benzamidothiocarbonyl-2-hydroxymethylpyridine (XIXb)—To a solution of 1.60 g of Ia in 10 ml of H₂O containing 1.4 g of K₂CO₃, a solution of 1.7 g of benzoyl isothiocyanate in 10 ml of CH₂Cl₂ was added and the mixture was stirred for 5 hr at room temperature and extracted with CH₂Cl₂. The extract was dried (Na₂SO₄) and evaporated to give a crude product, which was chromatographed over alumina using CH₂Cl₂ as eluent. The title compound was obtained and recrystallized from AcOEt as colorless needles, mp 130—131°; 0.892 g (31.2%). Anal. Calcd. for C₁₃H₁₁O₂N₃S: C, 68.53; H, 4.68; N, 14.63. Found: C, 55.63; H, 4.60; N, 14.68.

2-Anilinopyridinium[1,2-α]-1,3,4-thiadiazine Hydrogen Sulfate (XXa)—To 1 ml of conc. H₂SO₄ was added 0.527 g of XXa below 20° with moderate cooling and vigorous stirring. The resulting clear solution was stirred for 1 hr at room temperature and poured on 20 g of crushed ice. Colorless needles that separated were collected on a filter, washed with a little cooled water, and recrystallized from EtOH to pale yellow rods, mp 229—231°; 0.271 g. Anal. Calcd. for C₁₃H₁₁O₂N₃S·H₂SO₄: C, 46.02; H, 3.86; N, 12.39. Found: C, 46.22; H, 3.86; N, 12.55.

To aq. filtrate was basified with K₂CO₃, followed by the same treatment as described for XXIa, to give 218 mg of XXIa.

2,2'-Dianilinopyrazolo[1,5-α]pyridine-3,3'-disulfide (XXIa)—A solution of 200 mg of XXIa in 20 ml of H₂O was added with K₂CO₃ to give an yellow oil, which was extracted with CH₂Cl₂. The extract was dried (Na₂SO₄) and evaporated to give a crude product, which was recrystallized from CHCl₃—EtOH to 125 mg of yellow needles, mp 178°.

2,2'-Dibenzoazopyrazolo[1,5-α]pyridine-3,3'-disulfide (XXIb)—Four hundred milligrams of XXIb were dissolved in 1 ml of conc. H₂SO₄ below 20° with moderate cooling and stirring. After being stirred for 30 min, the mixture was poured on 20 g of crushed ice. The resulting clear solution was basified with K₂CO₃ and extracted with CH₂Cl₂. The extract was dried (Na₂SO₄) and evaporated to give a crude product, which was recrystallized from MeOH to yellow rods, mp 259—261°; 48 mg.

2-Anilinopyrazolo[1,5-α]pyridine (XXIIa)—To a solution of 196 mg of XXIIa in 40 ml of acetonitrile was added with stirring and the stirring was continued for 10 hr, during which time the reddish yellow color of the reaction mixture disappeared. After removal of Raney Ni, the solution was evaporated to dryness under a reduced pressure to give crude crystals (70 mg), which were recrystallized from hexane to colorless needles (33 mg), mp 94—96°.

2-Benzamidopyrazolo[1,5-α]pyridine (XXIIib)—The same treatment of XXIIb as for XXIIa gave XXIIib (32.6%) as for XXIIb (26.6%) as for XXIIb (26.6%) (26.6%) (26.6%) (26.6%).

2-Anilino-3-thiocyanopyrazolo[1,5-α]pyridine (XXIV) and 3-Thiocyan-2-(p-thiocyanopyridine)-derivatives (XXV)—To a solution of 200 mg of XXIIa and 400 mg of KCN in 2 ml of AcOH and 1 ml of H₂O a solution of 180 mg of Br₂ in 1 ml of AcOH was added dropwise at room temperature with stirring. After stirring for 3 hr, the mixture was poured into H₂O and the crude product separated was taken up in CH₂Cl₂. The CH₂Cl₂ layer was washed with NaHCO₃ solution, dried over Na₂SO₄, and evaporated. The resulting crystalline mass was chromatographed over alumina with CH₂Cl₂. The first fraction gave 0.164 g (61.7%) of XXV, which was recrystallized from AcOEt to colorless needles, mp 152—155°. The second fraction gave 0.105 g (32.5%) of XXV, recrystallized from AcOEt to colorless needles, mp 192—193°.

Pyridine-2-acetamidoxime (XXVII)—To a solution of 8.4 g (0.12 mole) of NH₂OH—HCl in 10 ml of H₂O a solution of 8.4 g of K₂CO₃ in 20 ml of H₂O was added gradually and then 30 ml of MeOH. Inorganic substance which precipitated was removed by filtration. To the filtrate was added 4.72 g (0.04 mole) of pyridine-2-acetonitrile and the mixture was refluxed on a water bath for 4 hr. After removal of the solvent under a reduced pressure, the residue was recrystallized from H₂O to 5.7 g (94.5%) of XXVII as colorless.
neat, mp 112—114°. *Anal.* Calculated for C$_{6}$H$_{12}$O$_{4}$Na: C, 55.61; H, 6.00; N, 27.80. Found: C, 55.90; H, 5.92; N, 27.82.

Reaction of XXVII with Ac$_{2}$O—To 30 ml of Ac$_{2}$O, 6.0 g of XXVII was added in small portions with stirring and the mixture was heated at 100° for 30 min. After the excess reagent was removed under reduced pressure, the residue was chromatographed over alumina with ether.

First Fraction: 51 mg of a compound, having an empirical formula C$_{11}$H$_{11}$O$_{4}$N$_{2}$, recrystallized from hexane as colorless needles, mp 118—119°.

Second Fraction: 2.432 g (32.9%) of 5-methyl-3-(2-pyridylmethyl)-1,2,4-oxadiazole (XXVIII) as colorless oil. Its picrate recrystallized from EtOH as yellow needles, mp 149—150°. NMR δ in CDCl$_{3}$: 5.65 (2H, singlet, -CH$_{2}$), 7.45 (3H, singlet, CH$_{3}$). *Anal.* Calculated for C$_{8}$H$_{10}$O$_{5}$N$_{4}$: C, 44.56; H, 2.99; N, 20.79. Found: C, 44.51; H, 3.21; N, 20.73.

Third Fraction: 67 mg of a compound having an empirical formula C$_{11}$H$_{11}$O$_{4}$N$_{2}$, recrystallized from hexane as pale yellow needles, mp 121°.

Fourth Fraction: 2.200 g (29.7%) of 2-acetamidopyrazolo[1,5-a]pyridine (XXIX), recrystallized from CHCl$_{3}$ or AcOEt–hexane as colorless rods, mp 112—113°. Its picrate was recrystallized from EtOH as yellow needles, mp 184°.

Fifth Fraction: 121 mg of a compound having an empirical formula C$_{11}$H$_{11}$O$_{4}$N$_{2}$, recrystallized from AcOEt as colorless rods, mp 149—150°.

Sixth Fraction: 161 g of 2-acetamido-3-acetylpyrazolo[1,5-a]pyridine (XXX), recrystallized from MeOH as colorless needles, mp 197—198°.

Reaction of XXVIII with Ac$_{2}$O—A mixture of 0.947 g of XXVIII in 4 ml of Ac$_{2}$O was refluxed for 3 hr and then evaporated to dryness. The residue was chromatographed over alumina using ether to give 0.205 g (21.6%) of the starting material, 0.366 g (38.7%) of XXIX, and 0.176 g (13.5%) of XXX. These products were identical with those obtained as above by IR spectral comparison, TLC, and mixed mp determination.

2-Acetamido-3-bromopyrazolo[1,5-a]pyridine (XXXIa)—To a solution of 366 mg of XXIX in 2.5 ml of AcOH, 0.377 g of Br$_{2}$ in 1 ml of AcOH was added and the mixture was allowed to stand for 10 hr. The deposited crystals were collected by filtration and the filtrate was diluted with water to precipitate the same compound. Total yield, 0.377 g. It was recrystallized from AcOEt to colorless needles, mp 169—170°.

b) The same treatment of XXX as for XXIX gave XXXIa (61%), which was identified with XXXIa obtained in a) from IR spectral comparison and mixed mp determination.

2-Aminopyrazolo[1,5-a]pyridine (XXXII)—A solution of 0.250 g of XXIX in 17% HCl was heated on a water bath for 1.5 hr and concentrated to about one-half the original volume under a reduced pressure. The resulting solution was basified with conc. NH$_{4}$OH to give an oily product which soon solidified. The solid was separated on a filter and recrystallized from ether–hexane to colorless plates, mp 62—63°; 171 mg (90%). Its picrate was recrystallized from EtOH as yellow needles, mp 176—178°.

XXXII was allowed to react with BzCl to give the XXXIIb, which was identical with XXXIIb obtained from XXIIb.

2-Acetamido-3-nitropyrazolo[1,5-a]pyridine (XXXIIb)—To a solution of 390 mg of XXIX in 2 ml of AcOH was added 0.5 ml of HNO$_{3}$ (d 1.52) with cooling in an ice-water bath. After standing for 30 min at the same temperature and then 2 hr at room temperature, the mixture was poured into water. The separated crystals were collected, washed with H$_{2}$O, dried, and recrystallized from CHCl$_{3}$–EtOH to pale brown scales, mp 256—259°; 364 mg.

2-Acetamido-3-thiocyanopyrazolo[1,5-a]pyridine (XXXIIc)—To a mixture of 0.800 g of XXIX and 1.4 g of KSCN in 6 ml of MeOH a solution of 0.8 g of Br$_{2}$ in 3 ml of MeOH saturated with KBr was added dropwise with stirring at room temperature. After the addition was completed, the mixture was allowed to stand overnight. Water was added to the mixture and the precipitated material was collected by filtration. It was recrystallized from MeOH to 0.665 g (70.5%) of pale blue needles, mp 199—200°.
