(Received November 4, 1980)

1,6-Anhydro-4',6'-O-benzylidene-3'O-tosyl-β-lactose was converted into 1,6-anhydro-2,2',3-tri-O-benzyl-4',6'-O-benzylidene-β-lactose (3) in 74.1% yield by benzylation followed by detosylation. Condensation of 3 with 2,3,4-tri-O-acetyl-α-L-fucopyranosyl bromide in benzene–nitromethane in the presence of mercuric cyanide and molecular sieves gave the corresponding trisaccharide derivatives (6 and 11) bearing α- and β-L-fucopyranosyl linkages in 37.1 and 43.1% yields, respectively. Compounds 6 and 11 were isolated by column chromatography on silica gel. The title sugars (10 and 15) were prepared in 4 steps from 6 and 11, respectively; hydrogenolytic removal of the benzylidene and benzyl groups, acetylation, cleavage of the 1,6-anhydro-β-ring to β-acetate, and deacetylation.

\textsuperscript{3}H-NMR and \textsuperscript{13}C-NMR spectral data of 10, 15, and the intermediates are also described.

**Keywords**—synthesis; 3’-O-α-L-fucopyranosyllactose; 3’-O-β-L-fucopyranosyllactose; human milk oligosaccharide; glycosylation; lactosan derivatives; 1,6-anhydro-β-trisaccharide derivatives; \textsuperscript{3}H-NMR; \textsuperscript{13}C-NMR

The fucosyl derivatives of lactose and lacto-N-tetraose are the major components of oligosaccharides in human milk.\textsuperscript{5) Among these shown to be present in human milk, 2'-O-α-L-fucopyranosyllactose and 3-O-α-L-fucopyranosyllactose have the simplest structures. Therefore, the title sugars are positional isomers of fucosylactoses in human milk with α- and β-L-fucopyranosyl linkages. Recently, the occurrence, in nature, of higher oligosaccharides that are structurally derived from lactose and one or more L-fucopyranosyl groups has also been reported.\textsuperscript{1)}

As an extension of our project of synthesizing oligosaccharides in human milk and their analogs, and those bearing α-L-fucopyranosyl such as 3-O,\textsuperscript{4) and 6-O-α-L-fucopyranosyl-di-N-acetylchitobiose,\textsuperscript{5)} we now describe syntheses and physical properties of the title sugars (10 and 15).

1,6-Anhydro-4',6'-O-benzylidene-3'O-tosyl-β-lactose (1), isolated in 15% yield by partial tosylation of 1,6-anhydro-4',6'-O-benzylidene-β-lactose,\textsuperscript{6)} is the starting material of our syntheses. Benzylation of 1 afforded 1,6-anhydro-2,2',3-tri-O-benzyl-4',6'-O-benzylidene-3'O-tosyl-β-lactose (2) as a syrup. Subsequent desotosylation of 2 with sodium amalgam gave 1,6-anhydro-2,2',3-tri-O-benzyl-4',6'-O-benzylidene-β-lactose (3) as white needles in 74.1% yield based on 1.

Condensation of 3 (1 mol eq.) with 2,3,4-tri-O-acetyl-α-L-fucopyranosyl bromide\textsuperscript{7) (5, 2.1 mol eq.) was carried out by stirring in benzene–nitromethane (1:1) in the presence of mercuric cyanide and molecular sieves at 60–65°C for 24 hr under nitrogen. After 24 hr, more 5 (2.1 mol eq.) was added and the reaction was continued for a further 24 hr. Thin-layer chromatography (TLC) showed the formation of two products, and each product was isolated by column chromatography on silica gel. From the earlier fractions, the trisaccharide bearing the α-L-fucopyranosyl linkage (6), O-(2,3,4-tri-O-acetyl-α-L-fucopyranosyl)-(1→3)-O-(2-O-benzyl-4,6-O-benzylidene-β-D-galactopyranosyl)-(1→4)-1,6-anhydro-2,3-di-O-benzyl-β-D-glucopyranose, was isolated as an amorphous powder in 37.1% yield. From the later fractions, the trisaccharide bearing the β-L-fucopyranosyl linkage (11), O-(2,3,4-tri-O-acetyl-β-L-fucopyranosyl)-
(1→3)-O-[2-O-benzyl-4,6-O-benzylidene-β-D-galactopyranosyl]-(1→4)-1,6-anhydro-2,3-di-O-benzyl-β-D-glucopyranose, was isolated as needles in 43.1% yield. The proton nuclear magnetic resonance (1H-NMR) spectra of 6 and 11 were in full agreement with their proposed structures. Trisaccharide derivatives bearing α-1-fucopyranosidic linkages (7–10) and those with the β-linkages (12–15) were then prepared from 6 and 11, respectively, as described below.

\[ 1 : R^1 = H, \ R^2 = Ts \\
2 : R^1 = Bn, \ R^2 = Ts \\
3 : R^1 = Bn, \ R^2 = H \\
4 : R^1 = Bn, \ R^2 = Ac \]

\[
\text{Ac} = \text{acetyl}, \ \text{Bn} = \text{benzyl}, \ \text{Me} = \text{methyl}, \ \text{Ph} = \text{phenyl}, \ \text{Ts} = \text{tosyl}
\]

Chart 1

Compound 6 was converted into the 1,6-anhydro-β-trisaccharide octaacetate (7), O-[2,3,4-tri-O-acetyl-α-L-fucopyranosyl]-(1→3)-O-[2,4,6-tri-O-acetyl-β-D-galactopyranosyl]-(1→4)-2,3-di-O-acetyl-1,6-anhydro-β-D-glucopyranose, by catalytic hydrogenation (which resulted in debenzylideneation with simultaneous debenzylation), followed by acetylation. Deacetylation of 7 afforded the 1,6-anhydro-β-trisaccharide (8), O-α-L-fucopyranosyl-(1→3)-O-β-D-galactopyranosyl-(1→4)-1,6-anhydro-β-D-glucopyranose, as an amorphous powder. The corresponding crystalline 1,6-anhydro-β-trisaccharide octaacetate (12) and 1,6-anhydro-β-trisaccharide (13) bearing β-1-fucosidic linkages were prepared from 11 by methods analogous to those described for the preparation of the α-isomers (7 and 8).

The 1H-NMR spectrum of 8 was measured in deuterium oxide (D₂O) containing deuteromethanol (CD₃OD), and that of 13 was measured in D₂O. The signals due to anomeric protons were assigned by comparison with those of methyl α- and β-L-fucopyranosides and 1,6-anhydro-β-lactose. In 8 or 13, the anomeric proton due to the fucopyranosidic linkage (H-1') appeared as a doublet at 4.99 or 4.57 ppm with a coupling constant (J = 3.5 or 7 Hz, respectively) consistent with the assigned α- or β-L-fucopyranosyl configuration for 8 or 13. The configurations of the newly established glycosidic linkages were further confirmed by carbon-13 magnetic resonance (13C-NMR) spectroscopy as mentioned later.

The 1,6-anhydro-β-ring of 7 was cleaved by heating to reflux in chloroform with titanium tetrabromide. Subsequent treatment of the resulting crude bromide with mercuric acetate (in order to replace the bromine atom by an acetoxyl group), followed by column chromatographic
purification, afforded the β-anomer of the trisaccharide nonaacetate (9), O-(2,3,4-tri-O-acetyl-
α-1-fucopyranosyl)-(1→3)-O-(2,4,6-tri-O-acetyl-β-1-d-galactopyranosyl)-(1→4)-1,2,3-tri-O-acetyl-
β-1-glucopyranose, as an amorphous powder in 59.7% yield. The anomeric-proton doublet
due to terminus glucose appeared at δ 5.68 ppm with a coupling constant (J = 8 Hz) charac-
teristic of the β linkage.

Deacetylation of 9 gave O-α-1-fucopyranosyl-(1→3)-O-β-1-d-galactopyranosyl-(1→4)-α-1-
glucopyranose (3′-O-α-1-fucopyranosyl-α-lactose) (10). The product crystallized from aqueous
ethanol as fine needles and showed mutarotation, −25.3° (3 min)→−30° (3 hr, constant).
Baer and Abbas3 obtained 3′-O-α-1-fucopyranosyllactose as a white powder, [α]D30 −39° (3
min)→−42.6° (2 hr, final).

The trisaccharide nonaacetate (14) and trisaccharide (15) bearing the β-1-fucopyranosidic
linkages were obtainable from 12 by methods similar to those described in the preparations
of 9 and 10. O-β-1-Fucopyranosyl-(1→3)-O-β-1-d-galactopyranosyl-(1→4)-β-1-glucopyranose
(3′-O-β-1-fucopyranosyllactose) (15) crystallized as an anomeric mixture, [α]D30 +67.1° (no
mutarotation). Baer and Abbas3 obtained the α-anomer of 3′-O-β-1-fucopyranosyllactose
as a white solid, [α]D30 +54.2° (initial)→+51° (4 hr, constant).

Partial hydrolysis of 10 or 15 with hydrochloric acid resulted in the liberation of fucose
and lactose, while complete hydrolysis liberated fucose, galactose, and glucose: they were
identified by TLC.

The 13C-NMR spectral data of the title sugars (10 and 15) and the corresponding 1,6-
anhydro-β-derivatives (8 and 13) are summarized in Table I. The signals were assigned by
comparison with observed values for methyl α- and β-l-fucopyranosides (indicated in Table II) and with literature values for 1,6-anhydro-β-lactose,9) and α- and β-lactoses.10) The signals for the corresponding carbon atoms in methyl α-l-fucopyranoside and fucosyl residues of 8 and 10 showed similar chemical shifts, which established that 8 and 10 had an α-l-fucopyranosidic linkage. Similarly, 13 and 15 had a β-l-fucopyranosidic linkage. The resonances for C-3' of 8, 13, 10, and 15 appeared at 81.3, 80.6, 81.6, and 80.9 ppm, respectively. They were deshielded by 8.2—7.5 or 8.1—7.4 ppm as compared to the chemical shifts for C-3' of 1,6-anhydro-β-lactose (73.1 ppm) or lactose (73.5 ppm), respectively. The results provide an unequivocal proof of the positions of the newly introduced l-fucosyl linkages in 8, 10, 13, and 15.

<sup>a</sup> Assignments of each carbon were made by reference to Lemieux and Driguez.  
<sup>b</sup> Assignments of each carbon were made by reference to Tsai and Behrman.  

After this work had been completed, Baer and Abbas<sup>3</sup> reported the syntheses of the title sugars. They prepared the fucosylactose derivatives bearing an α-l-fucopyranosyl linkage by condensation of 1,2,3,6,6'-hexa-O-acetyl-α,β-lactose (16) with 2,3,4-tri-O-benzyl-α-l-
fucopyranosyl bromide by a bromide ion-catalyzed reaction, while those bearing the β-linkage were prepared by condensation of 5 and 16 under Koenigs-Knorr conditions. The final products were separated as amorphous solids. They reported no 13C-NMR spectral data throughout the paper.

**Experimental**

Instruments used and conditions for chromatography were the same as in Part XIII unless otherwise indicated. TLC was performed with the following solvent combinations (v/v): (A) CHCl₃-acetone (3:1); (B) benzene-ether (1:1); (C) ether-AcOEt (3:1); (D) CHCl₃-ether-MeOH (10:10:1). Solvent combinations for elution on column chromatography with Kiesel-gel 60 (Merck, 70–230 mesh) are shown as v/v.

1,6-Anhydro-2,2′,3-tri-O-benzyl-4′,6′-O-benzylidene-β-lactose (3)—1,6-Anhydro-2,2′,3-tri-O-benzyl-4′,6′-O-benzylidene-3′-O-tosyl-β-lactose (2): Benzyl bromide (11.4 ml, 96.1 mmol) was added dropwise with stirring at 0°C to a mixture of 1,6-anhydro-4′,6′-O-benzylidene-3′-O-tosyl-β-lactose (1) (3 g, 5.3 mmol), BaO (6.6 g, 43 mmol), and Ba(OH)₂·8H₂O (2.82 g, 8.95 mmol) in dry N,N-dimethylformamide (60 ml). Stirring was continued at room temperature for 48 hr, then the mixture was poured into ice-H₂O (300 ml), and after being stirred for 24 hr, it was filtered, and the filtrate was extracted with CHCl₃ (3×100 ml). The extracts were washed successively with H₂O, 10% H₂SO₄, H₂Oaq, NaHCO₃, and H₂O, dried (MgSO₄), and concentrated to give a syrup, that was chromatographed on a column with benzene–ether (5:1). After benzyl alcohol had emerged, 2 was eluted and isolated as a syrup (5.2 g).

2) Detosylation of 2: 2% sodium amalgam (20 g) was added with stirring to a solution of 2 (5.2 g) in dry MeOH (150 ml), and stirring was continued at room temperature overnight. The mixture was filtered, and the filtrate was neutralized with glacial AcOH. After removal of the solvent, the residue was treated with CH₂Cl₂ (100 ml) and H₂O (100 ml) under stirring to effect dissolution. The organic layer was separated, washed with H₂O (3×100 ml), dried (MgSO₄), and concentrated to a syrup (3.87 g), which was crystallized from EtOH. Recrystallization from EtOH gave 3 (2.68 g, 74.1% based on 1) as white needles, mp 78—80°C, [α]₉₀° = -41.5° (c=0.88, CHCl₃). IR νₓₓ×cm⁻¹: 3280 (OH). H-NMR (CDCl₃): 7.20—7.68 (20H, m, aromatic protons). TLC: Rf 0.52 (solvent A), 0.07 (B), 0.22 (C), 0.32 (D). Anal. Calcd for C₁₄H₂₄O₁₅C: C, 70.37; H, 6.20. Found: C, 70.42; H, 6.02.

3′-O-Acetyl-1,6-anhydro-2,2′,3-tri-O-benzyl-4′,6′-O-benzylidene-β-lactose (4)—Acetylation of 3 (150 mg, 0.22 mmol) was carried out with Ac₂O (2 ml) and pyridine (2 ml) at room temperature overnight. The mixture was then concentrated by repeated co-distillation with toluene. The residue was dissolved in CH₂Cl₂, successively washed with H₂O, 10% H₂SO₄, H₂Oaq, NaHCO₃, and H₂O, dried (MgSO₄), and concentrated to give 4 (135 mg, 84.8%) as an amorphous powder, [α]₉₀° = +7.5° (c=1.7, CHCl₃). H-NMR (CDCl₃): 2.02 (3H, s, OAc), 7.08—7.52 (20H, m, aromatic protons). TLC: Rf 0.78 (solvent A), 0.24 (B), 0.58 (C), 0.57 (D). Anal. Calcd for C₁₅H₂₅O₁₅C: C, 69.60; H, 6.12. Found: C, 69.66; H, 5.82.

O-(2,3,4-Tri-O-acetyl-α-L-fucopyranosyl)-(1→3)-O-(2,0-benzyl-α-L-fucopyranosyl)-(1→4)-1,6-anhydro-2,3-di-O-benzyl-β-D-glucopyranosyl-(1→6)-0-(2,0-benzyl-4,6-di-O-benzylidene-β-D-glucopyranosyl)-(1→4)-1,6-anhydro-2,3-di-O-benzyl-β-D-glucopyranose (9)—Crystalline 2,3,4-tri-O-acetyl-α-L-fucopyranosyl bromide (5) (3 g, 8.5 mmol), mercuric cyanide (2.4 g, 9.5 mmol), and powdered 4 Å molecular sieves (3 g) were successively added to a solution of 3 (2.75 g, 4 mmol) in dry benzene–nitromethane (1:1, v/v, 60 ml). The suspension was stirred under nitrogen at 60—65°C for 24 hr. After 24 hr, more 3 (5 g) and mercuric cyanide (2 g) were added and stirring was continued for another 24 hr. The mixture was diluted with benzene (100 ml), filtered, and the filtrate was successively washed with H₂O, aq. NaHCO₃, and H₂O, then dried (MgSO₄), and concentrated to give an amorphous powder (7.18 g) that was chromatographed on a column with ether-AcOEt (15:1). From the earlier fractions, 6 (1.43 g, 37.1%) was isolated as an amorphous powder, [α]₉₀° = -68.8° (c=0.9, CHCl₃). IR νₓₓ×cm⁻¹: 1735 (OAc). H-NMR (CDCl₃): 0.95 (3H, d, J₉′₧₈′ = 6.5 Hz, CH₃ₙ), 1.64, 1.99, 2.13 (9H, all s, OAc x 3), 5.45 (1H, s, H-1, β-Glc), 7.19—7.54 (20H, m, aromatic protons). TLC: Rf 0.69 (solvent A), 0.10 (B), 0.41 (C), 0.49 (D). Anal. Calcd for C₁₅H₂₆O₁₅C: C, 65.40; H, 6.12. Found: C, 65.25; H, 6.11.

From the later fractions with the same solvent, 11 was isolated as an amorphous powder (1.66 g, 43.1%) that crystallized from AcOEt–ether–petr. ether (5:5:1) as white needles, mp 106—108°C, [α]₉₀° = +1.3° (c=1.4, CHCl₃). IR νₓₓ×cm⁻¹: 1741 (OAc). H-NMR (CDCl₃): 1.10 (3H, d, J₉′₧₈′ = 6.5 Hz, CH₃ₙ), 1.55, 1.95, 2.16 (9H, all s, OAc x 3), 5.43 (1H, s, H-1, β-Glc), 7.14—7.44 (20H, m, aromatic protons). TLC: Rf 0.59 (solvent A), 0.04 (B), 0.25 (C), 0.36 (D). Anal. Calcd for C₁₅H₂₆O₁₅C: C, 65.40; H, 6.12. Found: C, 65.10; H, 6.05.

O-(2,3,4-Tri-O-acetyl-α-L-fucopyranosyl)-(1→3)-O-(2,4,6-tri-O-acetyl-β-D-galactopyranosyl)-(1→4)-2,3-di-O-acetyl-1,6-anhydro-β-D-glucopyranose (7)—A solution of 6 (860 mg, 0.9 mmol) in dry MeOH (20 ml) was hydrogenated overnight in the presence of a Pd catalyst, freshly prepared from PdCl₂ (500 mg), at room temperature under atmospheric pressure. After filtration, the filtrate was concentrated to an amorphous powder (600 mg) that was acetylated with Ac₂O (10 ml) and pyridine (10 ml) at room temperature overnight. The mixture was poured into ice-H₂O (100 ml), stirred for 3 hr, and the whole was extracted with CH₂Cl₂ (3×30 ml). The extracts were successively washed with H₂O, 10% H₂SO₄, H₂Oaq, NaHCO₃, and H₂O,
dried (MgSO₄), and concentrated to an amorphous powder (821 mg) that was chromatographed on a column with CHCl₃-acetone (12: 1). The eluate provided 7 (660 mg, 90.9%) as an amorphous powder, [x]D = −82.2° (c=0.5, CHCl₃). IR νmax cm⁻¹: 1728 (O=O). ¹H-NMR (CDCl₃): 1.15 (3H, d, J=6.5 Hz, CH₃), 1.97, 2.04, 2.11, 2.16, 2.20 (24H, all s, OAc×8), 5.44 (1H, s, H-1, β-Glc). TLC: Rf 0.48 (solvent A), 0.04 (B), 0.25 (C), 0.33 (D). Anal. Calcd for C₉₇H₁₄₀O₃₇: C, 50.62; H, 5.75. Found: C, 50.38; H, 5.67.

O-α-L-Fucopyranosyl-(1→3)-O-β-D-galactopyranosyl-(1→4)-1,6-anhydro-β-D-glucopyranosyl (8) —— 0.5 N

Methanolic MeONa (0.6 ml) was added dropwise under stirring to a chilled solution of 7 (120 mg, 0.15 mmol) in dry MeOH (6 ml). After being stirred overnight at room temperature, the mixture was neutralized with Amberlite IR-120 (H⁺) resin, filtered, and concentrated to dryness to give 8 as a hydroscopic amorphous powder (92 mg, 87.9%), [x]D = −89.4° (c=0.9, H₂O). IR νmax cm⁻¹: 3330 (OH). ¹H-NMR (D₂O-CD₂OD): 1.04 (3H, d, J=6.5 Hz, CH₃), 4.33 (1H, d, J=7 Hz, H-1', β-Gal), 4.99 (1H, d, J=3.5 Hz, H-1', α-Fuc), 5.18 (1H, s, H-1, β-Glc). ¹³C-NMR: see Tables I and II. TLC: Rf 0.42 (70%aq. 2-ProH-ACOEt, 2:1, v/v). Anal. Calcd for C₃₇H₄₆O₁₃: C, 42.68; H, 6.76. Found: C, 42.38; H, 6.78.

O-(2,3,4-Tri-O-acetyl-α-L-fucopyranosyl)-(1→3)-O-(2,4,6-tri-O-acetyl-β-D-galactopyranosyl)-(1→4)

1,2,3-tri-O-acetyl-β-D-glucopyranosyl (9) ——- Crystalline titanium tetrabromide (ca. 1 g) was added to a solution of 7 (220 mg, 0.27 mmol) in dry CHCl₃ (6 ml). The mixture was boiled to reflux for 5 hr under stirring with exclusion of moisture, cooled, and diluted with CHCl₃ (20 ml). The solution was washed with chilled H₂O (3×30 ml), dried (MgSO₄), and concentrated to an amorphous powder (267 mg). The residue was treated with Ac₂O (8 ml) and mercuric acetate (270 mg) overnight at room temperature, poured into ice-H₂O (50 ml), and the whole was extracted with CHCl₃ (3×20 ml). The extracts were washed with aqueous NaHCO₃ and H₂O, dried (MgSO₄), and evaporated to dryness; TLC with solvent A showed the presence of 9, a small amount of unreacted 7, and unidentified by-products. The residue was chromatographed on a column with CHCl₃-acetone (5:1). After 7 (29 mg, 13.2%) had been recovered from the earlier fractions, 9 was isolated from the later fractions as an amorphous powder (141 mg, 59.7%), [x]D = −58.3° (c=0.5, CHCl₃). IR νmax cm⁻¹: 3430 (OH), 1736 (OAc). ¹H-NMR (CDCl₃): 1.14 (3H, d, J=6.5 Hz, CH₃), 1.98, 2.03, 2.09, 2.16, 2.22 (27H, all s, OAc×9), 5.68 (1H, d, J=8 Hz, H-1, β-Glc). TLC: Rf 0.31 (solvent A), 0.33 (C), 0.31 (D). Anal. Calcd for C₃₇H₄₆O₁₃·2H₂O: C, 49.37; H, 5.87. Found: C, 49.25; H, 5.75.

O-α-L-Fucopyranosyl-(1→3)-O-β-D-glucopyranosyl-(1→4)-α-L-fucopyranosyl-(3′,5′-O-acetyl)-α-lactose (10)— —- Decaetylation of 9 (100 mg, 0.11 mmol) in dry MeOH (10 ml) with 5 N methanolic MeONa (0.5 ml as needed) for 10 h gave an amorphous powder which crystallized fromaq. EtOH as fine needles (51 mg, 91.8%). The product began to brown at 245° and decomposed at 255°-257° (3 min) —→ 300° (3 hr, constant, c=0.3, H₂O). IR νmax cm⁻¹: 3390 (OH). ¹H-NMR (D₂O): 1.67 (3H, d, J=6.5 Hz, CH₃), 4.93 (1H, br, d, overlap with ring protons, H-1', β-Gal), 5.62 (1H, d, J=6.5 Hz, CH₃), 1.97, 2.05, 2.08, 2.09, 2.13, 2.15, 2.16 (24H, all s, OAc×8), 5.47 (1H, s, H-1, H-1', β-Glc). TLC: Rf 0.32 (solvent A), 0.14 (C), 0.22 (D). Anal. Calcd for C₃₇H₄₆O₁₃·2H₂O: C, 49.37; H, 5.75. Found: C, 49.25; H, 5.66.

Crystalline titanium tetrabromide (ca. 800 mg) was added to a solution of 7 (200 mg, 0.25 mmol) in dry CHCl₃ (6 ml), and the mixture was processed as described for the preparation of 9 to give an amorphous powder (217 mg). After treatment with Ac₂O (8 ml) and mercuric acetate (220 mg) as described for 9, the resulting amorphous powder (210 mg) was chromatographed on a column with CHCl₃-acetone (12:1). From the earlier fractions, unrecovered 12 (22 mg, 11%) was recovered. Further elution with the same solvent eluted 14 and, on removing the solvent, 14 was isolated as an amorphous powder (114 mg, 53%). The product crystallized from MeOH-ether as white needles, [x]D = +13.1° (c=0.31, CHCl₃). It became colorless at 133° and then melted at 138°. IR νmax cm⁻¹: 3420 (OH), 1742 (OAc). ¹H-NMR (CDCl₃): 1.21 (3H, d, J=6.5 Hz, CH₃), 1.96, 2.04, 2.09, 2.11, 2.16 (27H, all s, OAc×9), 5.71 (1H,
TLC: $R_f$ 0.18 (solvent A), 0.17 (C), 0.19 (D). Anal. Calcd for $C_{26}H_{38}O_{24}\cdot H_2O$: C, 48.87; H, 5.92. Found: C, 49.16; H, 6.20.

O-$\beta$-L-Fucopyranosyl-(1→3)-O-$\beta$-D-galactopyranosyl-(1→4)-D-glucopyranose (3′-O-$\beta$-L-Fucopyranosyllactose) (15) — Decostylation of 14 (120 mg, 0.14 mmol) in dry MeOH (5 ml) with 0.5 $n$ methanolic MeONa (0.5 ml) as described for the preparation of 8 gave 15 as an amorphous powder (60 mg, 91%) that crystallized from $C_6H_5O_2$-PrOH–AcOEt as fine needles, mp 265–267° (dec.), $[\alpha]_D^{20} + 67.1^\circ$ (no mutarotation, $c=0.29$, $H_2O$), $\Delta \sigma = 54.2^\circ$ (initial) $\rightarrow +51^\circ$ (4 hr, constant, $c=0.3$, $H_2O$). 1R $\nu_{max}^{CM}$ cm$^{-1}$: 3360 (OH). 1H-NMR (D$_2$O): 1.72 (3H, d, $J_{x',y'}=5.0$ Hz, CH$_3$), 5.10 ($<1H$, d, $J_{x,\beta}=8$ Hz, H-1($\beta$, $\beta$-Glc), 5.66 ($<1H$, d, $J_{x,\beta}=3.7$ Hz, H-1($\alpha$), $\alpha$-Glc), H-1′ and H-1″ signals overlapped with HO-D and could not be assigned. $^{13}$C-NMR: see Tables I and II. TLC: $R_f$ 0.48 (2-PrOH-acetone-1 m lactic acid, 2: 2: 1, v/v), 0.30 (70%aq. 2-PrOH–AcOEt, 2: 1, v/v). Anal. Calcd for $C_{34}H_{54}O_{26}\cdot H_2O$: C, 42.69; H, 6.77. Found: C, 42.53; H, 6.60.

TLC of the Acid Hydrolysate of 10 or 15 — 1) Partial Hydrolysis: A mixture of 10 or 15 (2 mg) and 0.1 $n$ HCl (2 ml) was heated at 95° for 30 min, then evaporated to dryness. The residue was dissolved in a small amount of $H_2O$, and subjected to TLC with 2-PrOH–acetone-1 m lactic acid (2: 2: 1, v/v) lactose ($R_f$ 0.47) and fucrose ($R_f$ 0.65) were identified.

2) Complete Hydrolysis: A mixture of 10 or 15 (2 mg) and 3 $n$ HCl (2 ml) was heated at 95° for 3 hr. Galactose ($R_f$ 0.55), glucose ($R_f$ 0.58), and fucrose ($R_f$ 0.65) were identified in the hydrolysate.

Measurement of $^{13}$C-NMR Spectra —— The $^{13}$C-NMR spectra were measured at 25 MHz with a JEOL JNM-FX-100 spectrometer in the pulse Fourier transform mode. The spectrum of 8 was measured in D$_2$O containing CD$_3$OD and the spectra of 10, 13, 15, and methyl $\alpha$- and $\beta$-L-fucopyranosides were measured in D$_2$O at room temperature. Tetramethylsilane (TMS) was used as an external standard; chemical shifts are given in ppm from TMS. The results are shown in Tables I and II.

Acknowledgement We thank Mrs. T. Kumagai for the $^1$H-NMR and $^{13}$C-NMR spectral measurements, and Misses S. Iwauchi and T. Naito for the microanalyses.
