(Received April 10, 1986)

In order to determine the structure of a new metabolite of 25-hydroxy-24-epivitamin D₂, 1,25-dihydroxy-22-dehydro-24-homo- and 26-homo-vitamin D₃ were synthesized. The saturated analogues at the C-22 position of these homovitamin D₃ compounds were also synthesized. For the construction of the side chain of these homo-analogues, the orthoester Claisen rearrangement of the allylic alcohol was employed.

Assay of binding of these compounds with the chick intestinal cytosol receptor protein for 1,25-(OH)₂D₃ was carried out by the displacement method. The results indicated that these homovitamin D₃ analogues are as active as 1,25-(OH)₂D₃. The bone calcium-mobilizing activities of these compounds were equivalent to that of 1,25-(OH)₂D₃.

Keywords—vitamin D analogue; bone calcium mobilization; 1,25-(OH)₂D₃ chick intestinal receptor; 1,25-dihydroxy-22-dehydro-24-homovitamin D₃; 1,25-dihydroxy-22-dehydro-26-homovitamin D₃; 1,25-dihydroxy-24-homovitamin D₃; 1,25-dihydroxy-26-homovitamin D₃

Introduction

Vitamin D₃ undergoes metabolic hydroxylation to produce a number of metabolites, among which 1,25-dihydroxyvitamin D₃ (1,25-(OH)₂D₃), a hormonal form of vitamin D₃, exhibits the highest biological activity of all vitamin D₃ metabolites.²⁾ In recent years, a great amount of synthetic effort has been directed toward the synthesis of vitamin D₃ metabolites and fluorine-substituted vitamin D₃ analogues in order to investigate the biological importance of the metabolism of vitamin D₃ and to obtain new analogues with high biological activity or without the full spectrum of vitamin D₃ activities.²⁾

During the course of our investigation into the metabolism of 25-hydroxy-24-epivitamin D₂, we isolated a new biologically active metabolite.³⁾ The mass spectrum (MS) of the metabolite suggested that it could be either 1,25-dihydroxy-22-dehydro-24-homovitamin D₃ (1,25-(OH)₂- Δ^{22} -24-homo-D₃) (**8**) or 1,25-dihydroxy-22-dehydro-26-homovitamin D₃ (1,25-(OH)₂- Δ^{22} -26-homo-D₃) (**18**). In order to determine the structure of the new metabolite, we chemically synthesized both compounds. We have also synthesized their C-22 saturated analogues, 1,25-(OH)₂-24-homo-D₃ (**11**) and 1,25-(OH)₂-26-homo-D₃ (**21**). The synthetic procedures and the results of preliminary studies of the biological activities of these compounds are reported in this paper.

Syntheses

For construction of the side-chain skeletons of these homovitamin D₃ analogues, we employed to orthoester Claisen rearrangement of the allylic alcohol **2** as a key reaction. Coupling of the known 22-aldehyde **1**^{4,5)} with vinylmagnesium bromide gave an epimeric

mixture of the allylic alcohol **2** in 94% yield, and this was used as such in the ensuing orthoester Claisen rearrangement. The 22*E*-dehydro-24-homo-ester **3** was obtained in 93% yield by treatment of **2** with an excess of triethyl orthoacetate in the presence of a catalytic amount of propionic acid in refluxing xylene. The ester **3** was treated with methylmagnesium bromide and subsequently hydrolyzed with 6M HCl at 50 °C to provide the triol **5** in 80% yield.

Transformation of the triol **5** into 1,25-(OH)₂-Δ²²-24-homo-D₃ (**8**) was carried out as follows. The 1,3-diacetate **6**, obtained by acetylation of **5**, was brominated at the C-7 position with *N*-bromosuccinimide in refluxing carbon tetrachloride and then dehydrobrominated

Chart 1

with tetra-*n*-butylammonium fluoride. Purification by preparative thin layer chromatography (TLC) gave the 5,7,22-triene **7** in 24% yield. Compound **7** was irradiated with ultraviolet (UV) light through a Vycor filter in a mixed solvent (benzene-ethanol, 2:1) at 0 °C for 5 min and the resulting mixture containing previtamin was refluxed for 1 h. The vitamin D₃ diacetate, isolated in 25% yield, was saponified with 5% KOH/MeOH to provide 1,25-(OH)₂-Δ²²-24-homo-D₃ (**8**) in 90% yield. Its structure was supported by the UV, proton nuclear magnetic resonance (¹H-NMR), and mass spectra.

For the synthesis of 1,25-(OH)₂-Δ²²-26-homo-D₃ (**18**), the allylic alcohol **2** was treated with trimethyl ortho-*n*-butyrate in place of triethyl orthoacetate to give the 22*E*-dehydro-26-homo-ester **12** in 97% yield. Introduction of a hydroxyl group at the C-25 position was achieved in 67% yield by treatment of the enolate of the ester **12** with oxygen followed by reduction with triethylphosphite.⁶ The hydroxy ester **13**, obtained as a mixture of C-25 epimers, was converted into the carbinol **14** by successive reactions of LiAlH₄ reduction, mesylation, and then LiAlH₄ reduction again. Removal of the protecting group provided the triol **15**, which was transformed into 1,25-(OH)₂-Δ²²-26-homo-D₃ (**18**) as described for **8**. The structure of **18** was established by measurement of the UV, ¹H-NMR, and mass spectra.

The C-22 saturated vitamin D₃ homologues **11** and **21** were prepared as follows. Selective hydrogenation at the C-22 double bond of **6** and **16** was achieved in ethyl acetate by using a 10% Pd-C catalyst under a hydrogen atmosphere in 92% and 85% yields, respectively. The resulting 5-ene compounds, **9** and **19**, were converted *via* the 5,7-dienes, **10** and **20**, into 1,25-(OH)₂-24-homo-D₃ (**11**) and 1,25-(OH)₂-26-homo-D₃ (**21**), respectively, as described for **8**.

It was found that the UV absorption and mass spectra of the synthetic 1,25-(OH)₂-Δ²²-26-homo-D₃ (**18**) are identical with those of the new biologically active metabolite of 25-hydroxy-24-epivitamin D₂. The synthetic analogue comigrated with the metabolite on both normal- and reversed-phase high-performance liquid chromatography (HPLC). The details

Fig. 1. Displacement of 1,25-(OH)₂-[26,27-³H]-D₃ from the Chick Intestinal Cytosol Receptor Protein for 1,25-(OH)₂D₃ by 1,25-(OH)₂-Δ²²-24-homo-D₃ (**8**), 1,25-(OH)₂-24-homo-D₃ (**11**), 1,25-(OH)₂-Δ²²-26-homo-D₃ (**18**), and 1,25-(OH)₂-26-homo-D₃ (**21**)

will be published elsewhere.³⁾

Biological Activities

The biological activities of side-chain analogues of 25-hydroxyvitamin D₃, including 24-homo derivatives, have been investigated by Okamura *et al.*^{7,8)} They reported that lengthening or particularly shortening the side-chain of 25-hydroxyvitamin D₃ by as little as one methylene group dramatically depressed the vitamin D₃ activities. Since the biological activities of the side-chain homologues of 1,25-(OH)₂D₃ have not been reported, the 24- and 26-homologues synthesized as described above were assayed using intestinal receptor for 1,25-(OH)₂D₃. Displacement studies were carried out as described by Shepard *et al.*⁹⁾ The results show that the 24-homo analogues, despite the C-22 double bond, are as active as 1,25-(OH)₂D₃ in interacting with the chick intestinal cytosol receptor protein (Fig. 1A). The 26-homologues are also equally active, as shown in Fig. 1B. It is, therefore, apparent that the addition of one carbon, either on the 26-terminal methyl or within the side chain, does not modify the interaction with the receptor protein. These compounds are approximately equal in biological activity to 1,25-(OH)₂D₃, suggesting a considerable tolerance of the receptor site for an enlarged side chain.

The effects of the homologues on calcium metabolism *in vivo* were assessed by measuring their bone calcium-mobilizing activity in vitamin D-deficient rats. As shown in Tables I and II, the results demonstrated that 1,25-(OH)₂-Δ²²-26-homo-D₃ (**18**) and 1,25-(OH)₂-26-homo-D₃ (**21**) were as active as 1,25-(OH)₂D₃. On the other hand, 1,25-(OH)₂-Δ²²-24-homo-D₃ (**8**) and 1,25-(OH)₂-24-homo-D₃ (**11**) were slightly less active than 1,25-(OH)₂D₃. It is noteworthy that synthetic 1,25-(OH)₂-26,27-bishomovitamin D₃ exhibited more potent activity than 1,25-(OH)₂D₃.⁵⁾ The extremely high potency of those homologues for inducing

the differentiation of leukemic cells to normal macrophages will be reported in our forthcoming paper.¹⁰⁾

Experimental

General Directions—Melting points were determined with a hot-stage microscope and are uncorrected. ¹H-NMR spectra were taken with a Hitachi R-24A (60 MHz) in CDCl₃ with Me₄Si as an internal standard, unless otherwise noted. Mass spectra were obtained with a Shimadzu QP-1000 mass spectrometer at 70 eV. UV spectra were obtained in ethanol solution with a Shimadzu UV-200 double-beam spectrophotometer. Column chromatography was done on silica gel (E. Merck, Kieselgel 60, 70–230 mesh). Preparative thin layer chromatography was carried out on precoated plates of silica gel (E. Merck, Kieselgel 60 F₂₅₄, 0.25 mm thickness). The usual work-up refers to dilution with water, extraction with an organic solvent indicated in parenthesis, washing the extract to neutrality, drying over anhydrous magnesium sulfate, filtration, and removal of the solvent under reduced pressure. The following abbreviations are used; THP, tetrahydropyranyl; THF, tetrahydrofuran; ether, diethyl ether; MeOH, methanol.

1 α ,3 β -Bis(methoxymethoxy)chola-5,23-dien-22-ol (2)—A solution of vinyl bromide in THF (50%, 0.42 ml, 2.98 mmol) was added to magnesium (70 mg, 2.92 mmol) in THF (3 ml). The mixture was stirred at room temperature under argon for 30 min. To the resulting Grignard reagent, the aldehyde **1** (595 mg, 1.37 mmol) in THF (6 ml) was added at room temperature. The mixture was stirred at room temperature for 1 h, and the usual work-up (ether) gave a crude product, which was applied to a column of silica gel (30 g). Elution with hexane–ethyl acetate (3:1) gave the allylic alcohol **2** (595 mg, 94%) as an amorphous solid. ¹H-NMR δ : 0.70 (3H, s, 18-H₃), 1.02 (3H, s, 19-H₃), 3.35 (3H, s, –O–CH₃), 3.38 (3H, s, –O–CH₃), 3.69 (1H, m, 1 β -H), 4.20 (1H, m, 22-H), 4.64 (2H, ABq, $J=7$ Hz, $\Delta AB=11$ Hz, 1 α -O–CH₂–O–), 4.65 (2H, s, 3 β -O–CH₂–O–), 5.52 (1H, m, 6-H), 4.90–6.0 (3H, m, 23-H and 24-H₂). MS m/z (%): 430 ($M^+ - \text{MeOH}$, 1.6), 400 (15), 368 (8.2), 340 (100), 338 (77), 283 (20), 253 (5.2). (Found: $M^+ - \text{MeOH}$, 430.3103. C₂₇H₄₂O₄ requires $M^+ - \text{MeOH}$, 430.3085).

(22E)-1 α ,3 β -Bis(methoxymethoxy)-27-norcholesta-5,22-dien-26-oic Acid Ethyl Ester (3)—A solution of the allylic alcohol **2** (590 mg, 1.28 mmol), triethyl orthoacetate (1.0 ml, 5.46 mmol), propionic acid (4 drops), and xylene (8 ml) was refluxed under argon for 2 h. Removal of the solvent under reduced pressure gave the residue, which was applied to a column of silica gel (30 g). Elution with hexane–ethyl acetate (4:1) gave the ester **3** (630 mg, 93%) as an oil. ¹H-NMR δ : 0.68 (3H, s, 18-H₃), 0.97 (3H, d, $J=6$ Hz, 21-H₃), 1.03 (3H, s, 19-H₃), 1.24 (3H, t, $J=7$ Hz, –CO₂CH₂CH₃), 3.35 (3H, s, –O–CH₃), 3.39 (3H, s, –O–CH₃), 3.70 (1H, m, 1 β -H), 4.11 (2H, q, $J=7$ Hz, –CO₂CH₂CH₃), 4.64 (2H, ABq, $J=7$ Hz, $\Delta AB=11$ Hz, 1 α -O–CH₂–O–), 4.65 (2H, s, 3 β -O–CH₂–O–), 5.29 (2H, m, 22-H and 23-H), 5.52 (1H, m, 6-H). MS m/z (%): 500 ($M^+ - \text{MeOH}$, 2.0), 470 (15), 455 (3.8), 438 (7.8), 410 (100), 408 (63), 255 (28), 253 (13), 155 (79). (Found: $M^+ - \text{MeOH}$, 500.3499. C₃₁H₄₈O₅ requires $M^+ - \text{MeOH}$, 500.3503).

(22E)-1 α ,3 β -Bis(methoxymethoxy)-24-homocholesta-5,22-dien-25-ol (4)—Methylmagnesium bromide (1 M solution in THF; 4.5 ml, 4.5 mmol) was added to a solution of the ester **3** (605 mg, 1.14 mmol) in THF (6 ml) at room temperature. The mixture was stirred at room temperature for 1 h. The usual work-up (ether) gave a crude product, which was applied to a column of silica gel (30 g). Elution with hexane–ethyl acetate (3:1) gave the alcohol **4** (538 mg, 93%) as an oil. ¹H-NMR δ : 0.68 (3H, s, 18-H₃), 0.97 (3H, d, $J=6$ Hz, 21-H₃), 1.01 (3H, s, 19-H₃), 1.21 (6H, s, 26-H₃ and 27-H₃), 3.33 (3H, s, –O–CH₃), 3.38 (3H, s, –O–CH₃), 3.70 (1H, m, 1 β -H), 4.64 (2H, ABq, $J=7$ Hz, $\Delta AB=11$ Hz, 1 α -O–CH₂–O–), 4.65 (2H, s, 3 β -O–CH₂–O–), 5.29 (2H, m, 22-H and 23-H), 5.50 (1H, m, 6-H). MS m/z (%): 486 ($M^+ - \text{MeOH}$, 2.2), 436 (21), 396 (100), 394 (84), 255 (30), 253 (13), 123 (58). (Found: $M^+ - \text{MeOH}$, 486.3717. C₃₁H₅₀O₄ requires $M^+ - \text{MeOH}$, 486.3711).

(22E)-24-Homocholesta-5,22-diene-1 α ,3 β ,25-triol (5)—A solution of the dimethoxymethyl ether **4** (540 mg, 1.04 mmol) in THF (15 ml) was treated with 6 M HCl (3 ml) at 50 °C for 2.5 h. The usual work-up (ethyl acetate) gave a crude product, which was applied to a column of silica gel (20 g). Elution with hexane–ethyl acetate (1:1) gave the triol **5** (428 mg, 95%) as crystals, mp 164–166 °C (hexane–ethyl acetate). ¹H-NMR δ : 0.68 (3H, s, 18-H₃), 0.95 (3H, d, $J=6$ Hz, 21-H₃), 1.00 (3H, s, 19-H₃), 1.20 (6H, s, 26-H₃ and 27-H₃), 3.80 (1H, m, 1 β -H), 3.92 (1H, m, 3 α -H), 5.30 (2H, m, 22-H and 23-H), 5.53 (1H, m, 6-H). MS m/z (%): 430 (M^+ , 15), 412 (96), 396 (12), 394 (30), 379 (12), 289 (38), 271 (39), 253 (49), 123 (100). (Found: C, 78.03; H, 10.66. C₂₈H₄₆O₃ requires C, 78.09; H, 10.77).

(22E)-1 α ,3 β -Diacetoxy-24-homocholesta-5,22-dien-25-ol (6)—A solution of the triol **5** (395 mg, 0.919 mmol) in pyridine (2 ml) was treated with acetic anhydride (1 ml) at room temperature for 16 h. The usual work-up (ethyl acetate) gave a crude product, which was applied to a column of silica gel (20 g). Elution with hexane–ethyl acetate (2:1) gave the diacetate **6** (361 mg, 77%) as an oil. ¹H-NMR δ : 0.67 (3H, s, 18-H₃), 0.97 (3H, d, $J=6$ Hz, 21-H₃), 1.07 (3H, s, 19-H₃), 1.21 (6H, s, 26-H₃ and 27-H₃), 2.01 (3H, s, acetyl), 2.04 (3H, s, acetyl), 4.98 (1H, m, 3 α -H), 5.05 (1H, m, 1 β -H), 5.31 (2H, m, 22-H and 23-H), 5.52 (1H, m, 6-H).

(22E)-1 α ,3 β -Diacetoxy-24-homocholesta-5,7,22-trien-25-ol (7)—A solution of the 5,22-diene **6** (51 mg, 0.0992 mmol) and *N*-bromosuccinimide (21 mg, 0.118 mmol) in carbon tetrachloride (3 ml) was refluxed under argon for 20 min. After the mixture had been cooled to 0 °C, the resulting precipitate was filtered off. The filtrate was concentrated below 40 °C to leave the residue, which was taken up in THF (5 ml) and treated with a catalytic amount

of tetra-*n*-butylammonium bromide at room temperature for 50 min. Then, the mixture was treated with a solution of tetra-*n*-butylammonium fluoride in THF (3.5 ml, 3.5 mmol) at room temperature for 30 min. The usual work-up (ethyl acetate) gave a crude product, which was submitted to preparative TLC (hexane–ethyl acetate, 4:1, developed five times). The band of *R_f* 0.48 was scraped off and the product was extracted with ethyl acetate. Removal of the solvent provided the 5,7,22-triene **7** (12.5 mg, 24%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 293, 282, 271.

(22*E*)-1 α ,25-Dihydroxy-22-dehydro-24-homovitamin D₃ (8)—A solution of the 5,7,22-triene **7** (7.3 mg, 0.0143 mmol) in benzene (90 ml) and ethanol (40 ml) was irradiated with a medium-pressure mercury lamp through a Vycor filter at 0 °C under argon for 5 min. The reaction mixture was refluxed under argon for 1 h. Removal of the solvent under reduced pressure gave a crude product, which was submitted to preparative TLC (hexane–ethyl acetate, 4:1, developed five times). The band of *R_f* 0.38 was scraped off and the product was extracted with ethyl acetate. Removal of the solvent gave the vitamin D₃ diacetate (1.8 mg, 25%). The band of *R_f* 0.43 was scraped off and the product was extracted with ethyl acetate.

The vitamin D₃ diacetate (1.1 mg, 2.14 μ mol) in THF (4 ml) was treated with 5% KOH/MeOH (1 ml) at room temperature for 20 min. The usual work-up (ethyl acetate) gave a crude product, which was submitted to preparative TLC (hexane–ethyl acetate, 1:2, developed three times). The band of *R_f* 0.43 was scraped off and the product was extracted with ethyl acetate. Removal of the solvent gave the vitamin D₃ analogue **8** (1.4 mg, 90%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 265, $\lambda_{\text{min}}^{\text{EtOH}}$ nm: 228, ¹H-NMR (360 MHz) δ : 0.55 (3H, s, 18-H₃), 1.02 (3H, d, *J* = 6.6 Hz, 21-H₃), 1.22 (6H, s, 26-H₃ and 27-H₃), 2.32 (1H, dd, *J* = 13.2, 6.7 Hz), 2.60 (1H, dd, *J* = 13.0, 3.0 Hz), 2.83 (1H, dd, *J* = 12.0, 3.0 Hz), 4.23 (1H, m, *W*_{1/2} = 18.4 Hz, 3 α -H), 4.43 (1H, m, *W*_{1/2} = 16.9 Hz, 1 β -H), 5.00 (1H, br s, *W*_{1/2} = 3.2 Hz, 19-H), 5.30 (1H, dd, *J* = 15.0, 7.1 Hz, 23-H or 22-H), 5.33 (1H, br s, *W*_{1/2} = 3.2 Hz, 19-H), 5.37 (1H, dd, *J* = 15.0, 5.8 Hz, 22-H or 23-H), 6.01 (1H, d, *J* = 11.0 Hz, 7-H), 6.32 (1H, d, *J* = 11.0 Hz, 6-H). MS *m/z* (%): 428 (M⁺, 3.9), 410 (82), 392 (100), 374 (20), 287 (4.8), 269 (21), 251 (38), 152 (10), 134 (30), 123 (54), 59 (4.2). (Found: M⁺, 428.3315. C₂₈H₄₄O₃ requires M⁺, 428.3392).

1 α ,3 β -Diacetoxy-24-homocholest-5-en-25-ol (9)—A mixture of the 5,22-diene **6** (40 mg, 0.0778 mmol) and 10% Pd–C (4 ml) in ethyl acetate (2 ml) was stirred at room temperature under hydrogen for 3 h. The Pd catalyst was filtered off and the filtrate was concentrated to leave the residue, which was applied to a column of silica gel (5 g). Elution with hexane–ethyl acetate (4:1) gave the 5-ene **9** (37 mg, 92%) as an oil. ¹H-NMR δ : 0.66 (3H, s, 18-H₃), 1.08 (3H, s, 19-H₃), 1.20 (6H, s, 26-H₃ and 27-H₃), 2.02 (3H, s, acetyl), 2.05 (3H, s, acetyl), 4.97 (1H, m, 3 α -H), 5.07 (1H, m, 1 β -H), 5.53 (1H, m, 6-H). MS *m/z* (%): 396 (M⁺ – 2AcOH, 55), 381 (9.0), 378 (5.2), 363 (5.4), 253 (5.2), 118 (100). (Found: M⁺ – 2AcOH, 396.3390. C₂₈H₄₄O requires M⁺ – 2AcOH, 396.3394).

1 α ,3 β -Diacetoxy-24-homocholesta-5,7-dien-25-ol (10)—The 5-ene **9** (19 mg, 0.037 mmol) was converted, as described for **7**, to the 5,7-diene **10** (5.8 mg, 31%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 283, 282, 271.

1 α ,25-Dihydroxy-24-homovitamin D₃ (11)—The 5,7-diene **10** (5.8 mg, 0.0113 mmol) was converted, as described for **8**, to the vitamin D₃ analogue **11** (1.1 mg, 23%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 265, $\lambda_{\text{min}}^{\text{EtOH}}$ nm: 228. MS *m/z* (%): 430 (M⁺, 5.5), 412 (51), 394 (100), 376 (18), 287 (3.8), 269 (9.4), 251 (21), 152 (9.0), 134 (28), 59 (7.1). (Found: M⁺, 430.3441. C₂₈H₄₆O₃ requires M⁺, 430.3449).

(22*E*,25 ξ)-1 α ,3 β -Bis(methoxymethoxy)-26-homocholesta-5,22-dien-27-oic Acid Methyl Ester (12)—A solution of the allylic alcohol **2** (390 mg, 0.844 mmol), trimethyl ortho-*n*-butyrate (0.7 ml) and propionic acid (3 drops) in toluene (6 ml) was refluxed under argon for 2 h. Removal of the solvent under reduced pressure gave a crude product, which was applied to a column of silica gel (20 g). Elution with hexane–ethyl acetate (5:1) gave the ester **12** (466 mg, 97%) as an oil. ¹H-NMR δ : 0.68 (3H, s, 18-H₃), 0.88 (3H, t, *J* = 7 Hz, –CH₂CH₃), 0.98 (3H, d, *J* = 6 Hz, 21-H₃), 1.03 (3H, s, 19-H₃), 3.38 (3H, s, –OCH₃), 3.43 (3H, s, –OCH₃), 3.68 (3H, s, –CO₂CH₃), 3.76 (1H, m, 1 β -H), 4.68 (2H, s, 3 β -O–CH₂–O–), 4.69 (2H, ABq, *J* = 7 Hz, Δ AB = 11 Hz, 1 α -O–CH₂–O–), 5.27 (2H, m, 22-H and 23-H), 5.56 (1H, m, 6-H). MS *m/z* (%): 514 (M⁺ – MeOH, 2.0), 484 (14), 452 (7.2), 424 (100), 422 (65), 283 (4.2), 253 (9.4), 169 (55). (Found: M⁺ – MeOH, 514.3636. C₃₂H₅₀O₅ requires M⁺ – MeOH, 514.3660).

(22*E*,25 ξ)-1 α ,3 β -Bis(methoxymethoxy)-25-hydroxy-26-homocholesta-5,22-dien-27-oic Acid Methyl Ester (13)—The ester **12** (437 mg, 0.800 mmol) in THF (5 ml) was added to a solution of lithium diisopropylamine (prepared with diisopropylamine (0.13 ml, 0.929 mmol), 1.56 M *n*-BuLi (0.59 ml) and THF (2 ml) and the mixture was stirred under argon at –78 °C for 30 min. Oxygen was bubbled into this solution and then triethylphosphite (0.14 ml, 0.817 mmol) was added. The usual work-up (ether) gave a crude product, which was applied to a column of silica gel (25 g). Elution with hexane–ethyl acetate (5:1) provided the hydroxy ester **13** (303 mg, 67%) as an oil. ¹H-NMR δ : 0.68 (3H, s, 18-H₃), 0.85 (3H, t, *J* = 7 Hz, –CH₂CH₃), 0.98 (3H, d, *J* = 6 Hz, 21-H₃), 1.02 (3H, s, 19-H₃), 3.08 (1H, br s, *W*_{1/2} = 3 Hz, –OH), 3.38 (3H, s, –OCH₃), 3.42 (3H, s, –OCH₃), 3.76 (3H, s, –CO₂CH₃), 4.68 (2H, s, 3 β -O–CH₂–O–), 4.68 (2H, ABq, *J* = 7 Hz, Δ AB = 22 Hz, 1 α -O–CH₂–O–), 5.32 (2H, m, 22-H and 23-H), 5.55 (1H, m, 6-H). MS *m/z* (%): 530 (M⁺ – MeOH, 2.0), 500 (15), 468 (7.0), 440 (100), 438 (64), 283 (5.2), 253 (11), 185 (8.2), 167 (13), 117 (9.4). (Found: M⁺ – MeOH, 530.3605. C₃₂H₅₀O₆ requires M⁺ – MeOH, 540.3609).

(22*E*,25 ξ)-1 α ,3 β -Bis(methoxymethoxy)-26-homocholesta-5,22-dien-25-ol (14)—Lithium aluminum hydride (20 mg, 0.526 mmol) was added to a solution of the hydroxyester **13** (294 mg, 0.539 mmol) in THF (5 ml), and this mixture was stirred at room temperature for 30 min. The usual work-up (ether for extraction) gave a crude diol. This was treated with methanesulfonyl chloride (0.04 ml, 0.517 mmol) and pyridine (1.5 ml) at room temperature for 30 min. The usual work-up (ether for extraction) gave a crude mesylate. Lithium aluminum hydride (20 mg,

0.526 mmol) was added to a solution of the crude mesylate in THF (5 ml), and the mixture was refluxed for 30 min. The usual work-up (ether) gave a crude product, which was applied to a column of silica gel (20 g). Elution with hexane–ethyl acetate (5:1) provided the alcohol **14** (190 mg, 70%) as an oil. $^1\text{H-NMR}$ δ : 0.71 (3H, s, 18- H_3), 0.90 (3H, t, $J=7$ Hz, $-\text{CH}_2\text{CH}_3$), 1.03 (3H, s, 19- H_3), 1.12 (3H, s, 27- H_3), 3.36 (3H, s, $-\text{OCH}_3$), 3.40 (3H, s, $-\text{OCH}_3$), 3.74 (1H, m, 1 β -H), 4.66 (2H, s, 3 β -O- CH_2 -O-), 4.67 (2H, ABq, $J=7$ Hz, $\Delta\text{AB}=11$ Hz, 1 α -O- CH_2 -O-), 5.35 (2H, m, 22-H and 23-H), 5.54 (1H, m, 6-H).

(22E,25E)-26-Homocholesta-5,22-diene-1 α ,3 β ,25-triol (15)—The dimethoxymethyl ether **14** (181 mg, 0.349 mmol) was converted, as described for **4**, to the triol **15** (147 mg, 98%), mp 85–87 °C (hexane–dichloromethane). $^1\text{H-NMR}$ δ : 0.69 (3H, s, 18- H_3), 0.89 (3H, t, $J=7$ Hz, $-\text{CH}_2\text{CH}_3$), 1.02 (3H, s, 19- H_3), 1.13 (3H, s, 27- H_3), 3.85 (1H, m, 1 β -H), 3.98 (1H, m, 3 α -H), 5.40 (2H, m, 22-H and 23-H), 5.60 (1H, m, 6-H). MS m/z (%): 430 (M^+ , 0.2%), 412 (1.2), 358 (36), 340 (46), 322 (5.8), 290 (6.0), 272 (31), 254 (13), 73 (100). (Found: C, 77.82; H, 10.59. $\text{C}_{28}\text{H}_{46}\text{O}_3$ requires C, 78.09; H, 10.77).

(22E,25E)-1 α ,3 β -Diacetoxy-26-homocholesta-5,22-dien-25-ol (16)—The triol **15** (100 mg, 0.233 mmol) was converted, as described for **5**, to the diacetate **16** (101 mg, 85%) as an amorphous solid. $^1\text{H-NMR}$ δ : 0.68 (3H, s, 18- H_3), 0.88 (3H, t, $J=7$ Hz, $-\text{CH}_2\text{CH}_3$), 0.98 (3H, d, $J=6$ Hz, 21- H_3), 1.08 (3H, s, 19- H_3), 1.12 (3H, s, 27- H_3), 2.03 (3H, s, acetyl), 2.06 (3H, s, acetyl), 4.98 (1H, m, 3 α -H), 5.06 (1H, m, 6-H). MS m/z (%): 394 ($\text{M}^+ - 2\text{AcOH}$, 14), 322 (96), 254 (84), 118 (100), 73 (95). (Found: $\text{M}^+ - 2\text{AcOH}$, 394.3222. $\text{C}_{28}\text{H}_{42}\text{O}$ requires $\text{M}^+ - 2\text{AcOH}$, 394.3238).

(24E,25E)-26-Homocholesta-5,7,22-triene-1 α ,3 β ,25-triol (17)—A solution of the 5,22-diene **16** (38 mg, 0.0739 mmol) and *N*-bromosuccinimide (19 mg, 0.107 mmol) in carbon tetrachloride (3 ml) was refluxed under argon for 20 min. The mixture was cooled to 0 °C, and the resulting precipitate was filtered off. The filtrate was concentrated below 40 °C to leave a residue. The THF (5 ml) solution of this residue was treated with a catalytic amount of tetra-*n*-butylammonium bromide at room temperature for 50 min. Then, the mixture was treated with a solution of tetra-*n*-butylammonium fluoride in THF (0.3 ml, 0.3 mmol) at room temperature for 30 min. The usual work-up (ethyl acetate) gave a crude triene. This triene in THF (5 ml) was treated with 5% KOH–MeOH (4 ml) at room temperature for 14 h. The usual work-up (ethyl acetate) gave a crude product, which was submitted to preparative TLC (benzene–ethyl acetate, 1:1, developed six times). The band of R_f 0.45 was scraped off and the product was extracted with ethyl acetate. Removal of the solvent provided the 5,7,22-triene **17** (8.7 mg, 40%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 293, 282, 271.

(22E,25E)-1 α ,25-Dihydroxy-22-dehydro-26-homovitamin D₃ (18)—A solution of the triene **17** (4.4 mg, 0.0103 mmol) in benzene (90 ml) and ethanol (40 ml) was irradiated with a medium pressure mercury lamp through a Vycor filter at 0 °C under argon for 2.5 min. The reaction mixture was refluxed under argon for 1 h. Removal of the solvent under reduced pressure gave a crude product, which was submitted to preparative TLC (benzene–ethyl acetate, 1:1, developed six times). The band of R_f 0.49 was scraped off and the product was extracted with ethyl acetate. Removal of the solvent provided the vitamin D₃ analogue **18** (0.91 mg, 21%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 265, $\lambda_{\text{min}}^{\text{EtOH}}$ nm: 228. $^1\text{H-NMR}$ (400 MHz) δ : 0.56 (3H, s, 18- H_3), 0.91 (3H, t, $J=7.6$ Hz, $-\text{CH}_2\text{CH}_3$), 1.04 (3H, d, $J=6.8$ Hz, 21- H_3), 1.13 (3H, s, 27- H_3), 4.23 (1H, m, $W_{1/2}=18.4$ Hz, 3 α -H), 4.43 (1H, m, $W_{1/2}=16.9$ Hz, 1 β -H), 5.00 (1H, br s, $W_{1/2}=3.2$ Hz, 19-H), 5.32 (1H, br s, $W_{1/2}=3.2$ Hz, 19-H), 5.37 (2H, m, 22-H and 23-H), 6.02 (1H, d, $J=11.5$ Hz, 7-H), 6.38 (1H, d, $J=11.5$ Hz, 6-H). MS m/z (%): 428 (M^+ , 15), 410 (25), 392 (20), 374 (1.0), 338 (6.8), 320 (4.4), 287 (9.0), 269 (15), 251 (14), 141 (8.6), 134 (99), 123 (8.2), 73 (100). (Found: M^+ , 428.3284. $\text{C}_{28}\text{H}_{44}\text{O}_3$ requires M^+ , 428.3292).

(25E)-1 α ,3 β -Diacetoxy-26-homocholest-5-en-25-ol (19)—The 5,22-diene **16** (35 mg, 0.0681 mmol) was converted, as described for **9**, to the 5-ene **19** (30 mg, 85%) as an amorphous solid. $^1\text{H-NMR}$ δ : 0.66 (3H, s, 18- H_3), 0.88 (3H, t, $J=7$ Hz, $-\text{CH}_2\text{CH}_3$), 1.08 (3H, s, 19- H_3), 1.12 (3H, s, 27- H_3), 2.02 (3H, s, acetyl), 2.04 (3H, s, acetyl), 4.97 (1H, m, 3 α -H), 5.04 (1H, m, 1 β -H), 5.51 (1H, m, 6-H). MS m/z (%): 396 ($\text{M}^+ - 2\text{AcOH}$, 52), 378 (12), 363 (5.8), 253 (5.2), 118 (100). (Found: $\text{M}^+ - 2\text{AcOH}$, 396.3380. $\text{C}_{28}\text{H}_{44}\text{O}$ requires $\text{M}^+ - 2\text{AcOH}$, 396.3394).

(25E)-26-Homocholesta-5,7-diene-1 α ,3 β ,25-triol (20)—The 5-ene **19** (22 mg, 0.0426 mmol) was converted, as described for **17**, to the 5,7-diene **20** (6.7 mg, 37%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 293, 282, 271.

(25E)-1 α ,25-Dihydroxy-26-homovitamin D₃ (21)—The diene **20** (4.8 mg, 0.0112 mmol) was converted, as described for **18** to the vitamin D₃ analogue **21** (1.3 mg, 27%). UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm: 265, $\lambda_{\text{min}}^{\text{EtOH}}$ nm: 228. MS m/z (%): 430 (M^+ , 2.9), 412 (9.7), 394 (8.8), 379 (2.3), 376 (0.9), 287 (2.0), 269 (4.1), 251 (5.9), 152 (30), 134 (100), 116 (17), 73 (89), 55 (69). (Found: M^+ , 430.3452. $\text{C}_{28}\text{H}_{46}\text{O}_3$ requires M^+ , 430.3449).

Measurement of Biological Activity—Determination of Serum Calcium in Rats: Weanling male rats were purchased from Holzman Co. (Madison, WI), and a low-calcium, vitamin D-deficient diet for 3 weeks. They were then subcutaneously given a test compound dissolved in 0.1 ml of 95% ethanol–propylene glycol (5:95) daily for 7 d. Each group consisted of 7 rats. Serum was obtained by centrifugation of clotted blood. Calcium was determined in the presence of 0.1% lanthanum chloride by means of a Perkin–Elmer atomic absorption spectrometer.

Displacement of 1,25-(OH)₂-[26,27-³H]-D₃ from Chick Intestinal Cytosol Receptor Protein for 1,25-(OH)₂D₃: Graded amounts of a test compound were dissolved in 0.05 ml of 95% ethanol. Triplicate determination of displacement of 1,25-(OH)₂-[26,27-³H]-D₃ from the receptor protein by unlabeled compounds was carried out as described by Shepard *et al.*⁹⁾ Authentic 1,25-(OH)₂D₃ was a generous gift from Hoffmann-La Roche Co., Nutley, N.J.
