Received June 30, 1993

Two diastereomeric macrocyclic lactone epoxides, *i.e.*, a 13-membered-ring monomeric lactone diepoxide (FL₁E₂, 7) and a 26-membered-ring dimeric lactone tetraepoxide (FL₂E₄, 8), were synthesized from *E,E*-farnesol by employing a new lactonization reaction with sodium hydride. Examinations by using a W-07 apparatus (liquid-membrane type) and by means of the human erythrocyte membrane method, have shown that FL₂E₄ (8) exhibits not only ion-transport activity for K⁺ ion but also ion-permeation activity for K⁺ ion across the human erythrocyte membrane, while FL₁E₂ (7) decreases the Na⁺ ion concentration inside human erythrocytes. Furthermore, we studied the dependence of the ionophoretic activities for K⁺ ion upon the epoxide configurations by using six diastereomers of FL₂E₄ (8).

Keywords farnesol-*E,E*; lactone epoxide macrocyclic; lactonization; ion-transport activity; ionophoretic activity; X-ray analysis

In the course of our studies on the chemical transformation of readily available acyclic terpenoids, we have reported preparations of menthofuran and juvabione from geraniol and nerol²⁾ and a synthesis of (±)-costunolide, an antitumor sesquiterpene lactone, from *E,E*-farnesol.³⁾ On the other hand, ionophores, which transport metal-cations across artificial or biological membranes, have recently received much attention because of their various important biological activities. Our interest in ionophores led us to develop three methods for the determination of ionophoretic activities; *e.g.*, the W-07 apparatus⁴⁾ for measuring ion-transport activity and the W-08 apparatus⁵⁾ for measuring ion-transport as well as ion-binding activities, both of glass-cell liquid-membrane type, and a method using human erythrocyte membrane⁶⁾ for measuring ion-permeation intensity. Since then, we have been engaged in the characterization of naturally occurring ionophores by means of those methods^{4–6)} (*e.g.*, Ca²⁺-ionophores of soya-cerebrosides⁵⁾), as well as synthetic studies of podant- and coronand-type terpenoid ionophores.⁷⁾ Recently, we have investigated Ca²⁺-ionophoretic activities of several synthetic analogs of soya-cerebroside II from the viewpoint of structure–activity relationship.⁸⁾

As a continuation of these studies, we describe in this paper: 1) syntheses of two macrocyclic lactone epoxides, *i.e.*, a monomeric lactone diepoxide (FL₁E₂, 7) and a dimeric lactone tetraepoxide (FL₂E₄, 8), from *E,E*-farnesol (1), 2) ionophoretic activities of FL₁E₂ (7) and FL₂E₄ (8) for Na⁺,

K⁺, and Ca²⁺ ions, and 3) comparisons of the ionophoretic activities of six diastereomers (8a–8f) of FL₂E₄ (8).⁹⁾

Syntheses of Monomeric Lactone Diepoxide (FL₁E₂) (7) and Dimeric Lactone Tetraepoxide (FL₂E₄) (8) from *E,E*-Farnesol (1) Oxidation of *E,E*-farnesyl acetate (1a), which was prepared from *E,E*-farnesol (1) by ordinary acetylation (Ac₂O–pyridine), with one equivalent of selenium dioxide in aqueous 95% ethanol furnished *ω*-hydroxyfarnesyl acetate (2) in 39% yield with 30% recovery of 1a. The *E* geometry of the newly introduced *ω*-hydroxyl function of 2 was presumed on the basis of the reaction mechanism of selenium dioxide oxidation¹⁰⁾ and was substantiated by the ¹H-NMR data for the *ω*-aldehydic derivative (2a) (δ_{CHO} 9.39),¹¹⁾ which was synthesized quantitatively by manganese dioxide oxidation of 2. Treatment of 2a with manganese dioxide and sodium cyanide in AcOH–MeOH¹²⁾ under Corey's oxidation conditions provided a methoxycarbonyl derivative (3) in 59% yield. Subsequent methanolysis of 3 furnished an *ω*-methoxycarbonyl farnesol (4), which was the substrate of the following lactonization reaction.

At first, we attempted lactonization of an *ω*-carbonyl farnesol (4a), prepared from the *ω*-methoxycarbonyl farnesol (4) by alkaline treatment, under several known lactonization conditions.¹³⁾ However, neither a monomeric lactone (FL₁, 5) nor a dimeric lactone (FL₂, 6) was obtained. Afterwards, we found that treatment of *ω*-methoxycarbonyl farnesol (4) with 5 eq of sodium hydride in an aprotic solvent [tetrahydrofuran (THF), benzene, or

TABLE I. Lactonization of ω -Methoxycarbonyl Farnesol (4) by Making Use of NaH (5.0 eq)

Solvent	Initial concentration of 4 (mol/l)	Yield (%) ^{a)}	
		FL ₁ (5)	FL ₂ (6)
THF	1.0×10^{-2}	8	72
THF	1.0×10^{-3}	46	36
Benzene	1.0×10^{-2}	14	61
Benzene	1.0×10^{-3}	55	33
Toluene	1.0×10^{-2}	48	41
Toluene	1.0×10^{-3}	72	24

a) Calculated from the isolated products.

Fig. 1. Ion-Transport Activity of FL₁E₂ (7) for Metal Ions
Initial concentration of sample: 0.03 mol/l in CHCl₃. Fig. 2. Ion-Transport Activity of FL₂E₄ (8) for Metal Ions
Initial concentration of sample: 0.03 mol/l in CHCl₃. $m_k = 9.38 \times 10^{-8}$ mol/h.

solvent used as well as by the initial concentration of the substrate 4, as shown in Table I. Thus, when the initial concentration of 4 was 1.0×10^{-2} mol/l in THF, the dimeric lactone (FL₂, 6) was obtained in high yield (72%) with a small amount (8%) of the monomeric lactone (FL₁, 5). On the other hand, when the initial concentration of 4 was 1.0×10^{-3} mol/l in toluene, the lactonization reaction resulted in 72% yield of FL₁ (5) and 24% yield of FL₂ (6).

The monomeric lactone (FL₁, 5) and the dimeric lactone (FL₂, 6) were then each subjected to *m*-chloroperbenzoic acid oxidation to obtain their epoxide derivatives, FL₁E₂ (7) and FL₂E₄ (8), both as diastereomeric mixtures.

Ionophoretic Activities of FL₁E₂ (7) and FL₂E₄ (8) The ionophoretic activities of the monomeric and dimeric lactone epoxides FL₁E₂ (7) and FL₂E₄ (8), as diastereomeric mixtures, for Na⁺, K⁺, and Ca²⁺ ions were initially examined by using a W-07 apparatus.⁴⁾ It was found that

toluene] under reflux afforded both desired lactones (5, 6) in excellent combined yield. The ratio of FL₁ (5) and FL₂ (6) in the reaction product was affected by the kind of

Fig. 3. Ion-Permeation Activities of FL₁E₂ (7) and FL₂E₄ (8) for Na⁺ Ion

Initial concentration of sample: 0.25 mmol/10⁹ red blood cells (RBC).

Fig. 4. Ion-Permeation Activities of FL₁E₂ (7) and FL₂E₄ (8) for K⁺ Ion

Initial ion concentration of sample: 0.25 mmol/10⁹ RBC.

Fig. 5. Ion-Permeation Activities of FL₁E₂ (7) and FL₂E₄ (8) for Ca²⁺ Ion

Initial ion concentration of sample: 0.25 mmol/10⁹ RBC.

FL₂E₄ (8, 0.03 mol/l in chloroform) exhibited ion-transport activity (9.38×10^{-8} mol/h) only for K⁺ ion (Fig. 2), while FL₁E₂ (7) did not show any ionophoretic activity for Na⁺, K⁺, or Ca²⁺ ion (Fig. 1).

Next, 7 and 8 were examined by using the human erythrocyte membrane method.⁶⁾ It was found that FL₂E₄ (8) increased the concentration of K⁺ ion inside erythrocytes (Fig. 4), whereas FL₁E₂ (7) slightly decreased the concentration of Na⁺ ion inside erythrocytes (Fig. 3). However, 7 and 8 did not significantly affect the Ca²⁺ ion concentration inside erythrocyte (Fig. 5).

Relative Stereostructures of Six Diastereomers of FL₂E₄ (8) Since the diastereomeric mixture FL₂E₄ (8) exhibited ion-transport and ion-permeation activities for K⁺ ion, we next examined the diastereostructure-ionophoretic activity relationship of 8. Thus, FL₂E₄ (8) was subjected to high-performance liquid chromatography (HPLC) and the six anticipated diastereomers, FL₂E₄-1 (8a), -2 (8b), -3 (8c), -4 (8d), -5 (8e), and -6 (8f), were separated in a ratio of

1:5:6:4:3:3.

The relative stereostructures of FL₂E₄-1 (8a), -3 (8c), -4 (8d), and -5 (8e) were determined by X-ray crystallographic analysis. PLUTO drawings of these dilactone-tetraepoxides are shown in Fig. 6 and torsion angles at the ring atoms are given in Table II. As is apparent from Table II, the torsion angles of O1-C1-C2-C3 and O1'-C1'-C2'-C3' indicate that the carbonyl moieties (O1-C1, O1'-C1') of

Fig. 6. PLUTO Drawings of FL₂E₄

Chart 3

FL₂E₄-3 (**8c**), FL₂E₄-4 (**8d**), and FL₂E₄-5 (**8e**) take an *anti* conformation with respect to the double bonds at C2–C3 and C2'–C3', while the corresponding carbonyls of FL₂E₄-1 (**8a**) are in *syn* conformation.

As for the stereostructures of FL₂E₄-2 (**8b**) and -6 (**8f**), it has been shown that **8b** is asymmetric while **8f** is symmetric from a consideration of the ¹H-NMR signals due to the methyls attached to the epoxide rings of **8b** (δ 1.26, 1.27, 1.35, 1.37, 3H each, all s) and **8f** (δ 1.19, 1.28, 6H each, both s). Consequently, the structures of **8b** and **8f** are assigned as shown in Chart 3.

Thus, FL₂E₄-1 (**8a**) and FL₂E₄-6 (**8f**) are C₂-symmetrical and FL₂E₄-4 (**8d**) and FL₂E₄-5 (**8e**) are S₂-symmetrical, whereas FL₂E₄-2 (**8b**) and FL₂E₄-3 (**8c**) are asymmetrical.

Ionophoretic Activities of Six Diastereomers of FL₂E₄ In order to clarify the relationship between the ionophoretic

activities and the stereostructures, we next examined the ionophoretic activities of the diastereomers of FL₂E₄ (**8**). Among the six diastereomers, FL₂E₄-1 (**8a**), FL₂E₄-5 (**8e**) and FL₂E₄-4 (**8d**), having symmetrical structures, were shown to exhibit stronger K⁺ ion transport activities than the parent diastereo-mixture (**8**), whereas FL₂E₄-2 (**8b**), FL₂E₄-6 (**8f**) and FL₂E₄-3 (**8c**) exhibited weaker activities. On the other hand, in regard to the K⁺ ion-permeation activity across human erythrocyte membrane, it was found that FL₂E₄-3 (**8c**), FL₂E₄-1 (**8a**) and FL₂E₄-2 (**8b**) exhibited stronger activities than the other three diastereomers (**8d**–**8f**).

The results revealed that FL₂E₄-1 (**8a**) possesses quite strong ion-transport and ion-permeation activities^{4,6} for K⁺ ion. In order to establish the mode of association between **8a** and K⁺ ion in solution, we next compared the ¹H-NMR spectra of FL₂E₄-1 (**8a**) taken in the absence and in the presence of K⁺ ion. The ¹H-NMR spectrum of **8a** taken in CDCl₃ saturated with D₂O showed a 12-proton singlet at δ 1.25 attributable to four methyl groups attached to epoxide rings and a 6-proton singlet at δ 1.83 due to two vinyl methyls. On the other hand, the spectrum of **8a**, taken in the same solvent system containing potassium tetrachloroplatinate (K₂PtCl₄), showed two 6-proton singlets at δ 1.25 and 1.60 ascribable to four methyl groups together with a 6-proton singlet signal of vinyl methyls at δ 1.83. These findings suggest that some epoxide oxygens in the molecule of FL₂E₄-1 (**8a**) are involved in the association with K⁺ cation. Furthermore, the conformation of FL₂E₄-1 (**8a**) in the solution may change in the presence of K⁺ ion for binding with the cation, since four epoxide rings in **8a** have been shown by X-ray analysis to be directed equally towards the outside of the plane of the macrocyclic dilactone ring.

Finally, it is noteworthy that FL₂E₄-3 (**8c**) showed the weakest ion-transport but the strongest ion-permeation activities among the six diastereomers. The apparently different ionophoretic activities observed in two different activity tests suggested that the increase of K⁺ ion inside erythrocytes may result from the operation of an active transport system, but further investigation is needed on this point.

Experimental

Melting points were determined on a Yanagimoto micro-melting point apparatus and recorded as observed. Optical rotations were measured in a 0.5 cm tube with a JASCO DIP-370 polarimeter. MS and high-resolution mass spectra (high MS) were taken on a JEOL JMS-D300 spectrometer. Infrared (IR) spectra were taken on a Hitachi 260-30 spectrometer. Ultraviolet (UV) spectra were taken on a Hitachi 330 UV-VIS spectrophotometer. ¹H-NMR spectra were recorded on JEOL GX-500 (500 MHz), EX-270 (270 MHz), and FX-90Q (90 MHz) spectrometers with tetramethylsilane (TMS) as an internal standard. Chemical shifts are given on the δ scale (ppm). The following abbreviations are used: s=singlet, d=doublet, t=triplet, m=multiplet and br=broad. Coupling constants (*J* value) are given in hertz (Hz). HPLC was carried out on Shimadzu LC-5A, LC-6A, and Waters C-201 chromatographs. X-Ray crystallographic data were collected on a Rigaku AFC-5 diffractometer using graphite-monochromated CuK α radiation. Column chromatography was performed on Kieselgel 60 (Merck, 70–230 mesh), and thin-layer chromatography (TLC) was carried out with pre-coated Kieselgel 60F₂₅₄ plates (Merck).

Selenium Dioxide Oxidation of *E,E*-Farnesyl Acetate (1a**)** A solution of *E,E*-farnesyl acetate (**1a**, 15.0 g, 56.8 mmol), which was prepared from *E,E*-farnesol (**1**, 14.2 g) by treatment with Ac₂O (8 ml) and pyridine (15 ml), in aqueous 95% EtOH (1 l) was treated with SeO₂ (6.62 g, 56.8 mmol,

Fig. 7. K⁺-Ion Transport Activities of FL₂E₄-1–6 (**8a**–**f**)
Initial concentration of sample: 0.03 M in CHCl₃.

Initial concentration of sample: 0.25 mmol/10⁹ RBC.

1.0 eq) and the mixture was stirred vigorously at 60 °C for 2 h. After rapid cooling to room temperature, the reaction mixture was poured into ice-water and the whole was extracted with EtOAc. The EtOAc extract was washed with aqueous saturated NaHCO_3 and aqueous saturated NaCl , then dried over MgSO_4 . Removal of the solvent under reduced pressure from the EtOAc extract gave a product (21 g), which was purified by column chromatography (SiO_2 1.0 kg, *n*-hexane:EtOAc=5:1) to furnish **2** (6.2 g, 22.1 mmol, 39%) and recovered **1a** (4.5 g, 17 mmol, 30%).

2: A colorless oil. IR (film): 3600—3100 (br), 1730, 1660 cm^{-1} . $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.62, 1.68, 1.71 (3H each, all brs, vinyl methyl $\times$ 3), 2.06 (3H, s, $-\text{OCOCH}_3$), 4.00 (2H, brs, $-\text{CH}_2\text{OH}$), 4.59 (2H, d, $J=7$ Hz, $-\text{CH}_2\text{OAc}$), 5.0—5.2 (1H, m, olefinic proton), 5.2—5.5 (2H, m, olefinic protons). MS m/z (%): 280 (M^+ , 2.6), 220 ($\text{M}^+ - \text{AcOH}$, 13.7), 93 (100). High-resolution MS m/z : Calcd for $\text{C}_{17}\text{H}_{28}\text{O}_3$: 280.204. Found: 280.206 (M^+).

Manganese Dioxide Oxidation of 2 A solution of **2** (6.2 g, 22.1 mmol) in *n*-hexane- CHCl_3 (10:1, 550 ml) was treated with MnO_2 ¹⁴ (39 g) and the whole mixture was stirred vigorously at room temperature for 5 h. After removal of the solid matter by filtration, the solvent was evaporated off under reduced pressure to yield the aldehydic derivative **2a** (6.61 g, 22.1 mmol, quantitative).

2a: A colorless oil. IR (film): 1745, 1690, 1645 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 204 (16000), 228 (15000). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.61, 1.67, 1.71 (3H each, all brs, vinyl methyl $\times$ 3), 2.01 (3H, s, $-\text{OCOCH}_3$), 4.55 (2H, d, $J=7$ Hz, $-\text{CH}_2\text{OAc}$), 5.0—5.5 (2H, m, olefinic protons), 6.44 (1H, br t, $J=ca.$ 6 Hz, olefinic proton), 9.35 (1H, s, $-\text{CHO}$). MS m/z (%): 278 (M^+ , 1.4), 218 ($\text{M}^+ - \text{AcOH}$, 46.9), 93 (100). High-resolution MS m/z : Calcd for $\text{C}_{17}\text{H}_{26}\text{O}_3$: 278.188. Found: 278.187 (M^+).

Oxidation of 2a with MnO_2 -NaCN-AcOH-MeOH NaCN (95%, 2.49 g, 50.8 mmol, 2.3 eq), MnO_2 (57.6 g, 0.66 mol, 30 eq) and freshly distilled AcOH (3.50 ml, 61.0 mmol, 2.8 eq) were added successively to a solution of **2a** (6.61 g, 22.1 mmol) in dry MeOH (500 ml), and the whole mixture was stirred vigorously at room temperature for 36 h. After removal of the solid matter by filtration, the filtrate was poured into ice-water and the whole was extracted with EtOAc. The EtOAc extract was washed with aqueous saturated NaHCO_3 and aqueous saturated NaCl , then dried over MgSO_4 . Removal of the solvent under reduced pressure from the EtOAc extract gave a product (8.0 g), which was purified by column chromatography (SiO_2 500 g, *n*-hexane:EtOAc=1:1) to furnish **3** (4.03 g, 13.1 mmol, 59%).

3: A colorless oil. IR (film): 1732, 1710, 1645 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 206 (18000), 216 (sh), 233 (sh). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.62, 1.72, 1.84 (3H each, all brs, vinyl methyl $\times$ 3), 2.06 (3H, s, OCOCH_3), 3.74 (3H, s, $-\text{COOCH}_3$), 4.60 (2H, d, $J=7$ Hz, $-\text{CH}_2\text{OAc}$), 5.0—5.5 (2H, m, olefinic protons), 6.74 (1H, br t, $J=ca.$ 6 Hz, olefinic proton). MS m/z (%): 308 (M^+ , 0.8), 248 ($\text{M}^+ - \text{AcOH}$, 40.2), 93 (100). High-resolution MS m/z : Calcd for $\text{C}_{18}\text{H}_{28}\text{O}_4$: 308.199. Found: 308.199 (M^+).

Alkaline Hydrolysis of 3 A solution of **3** (1.84 g, 5.97 mmol) in dry MeOH (20 ml) was treated with 10% KOH-MeOH (20 ml) and the whole was stirred at room temperature for 30 min. The reaction mixture was poured into ice-water and then extracted with EtOAc. Work-up of the EtOAc extract in the usual manner gave **4** (1.58 g, 5.97 mmol, quantitatively).

4: A colorless oil. IR (film): 3600—3100 (br), 1705, 1645 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 208 (16000), 217 (sh). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.63, 1.69, 1.85 (3H each, all brs, vinyl methyl $\times$ 3), 3.74 (3H, s, $-\text{COOCH}_3$), 5.14, 5.41 (1H each, both m, olefinic protons), 6.75 (1H, br t, $J=ca.$ 7 Hz, olefinic proton). MS m/z (%): 266 (M^+ , 1.7), 206 ($\text{M}^+ - \text{AcOH}$, 41.5), 93 (100). High-resolution MS m/z : Calcd for $\text{C}_{16}\text{H}_{26}\text{O}_3$: 266.372. Found: 266.373 (M^+).

Lactonization of 4 Giving 5 and 6 I) 1.0×10^{-2} mol/l in THF: A solution of **4** (15 mg, 5.64×10^{-2} mmol) in dry THF (5.64 ml) was treated with 60% NaH (11.3 mg, 0.282 mmol, 5.0 eq) and the mixture was heated under reflux for 2 h. After cooling, the reaction mixture was poured into aqueous saturated NH_4Cl and the whole was extracted with EtOAc. The EtOAc extract was washed with aqueous saturated NaCl , and then dried over MgSO_4 . Removal of the solvent under reduced pressure gave a product (25 mg), which was purified by column chromatography (SiO_2 5 g, *n*-hexane:EtOAc=20:1) to furnish **FL₁** (**5**, 1.1 mg, 4.70×10^{-3} mmol, 8.3%) and **FL₂** (**6**, 9.5 mg, 2.03×10^{-2} mmol, 72%).

II) 1.0×10^{-3} mol/l in THF: A solution of **4** (15 mg, 5.64×10^{-2} mmol) in dry THF (56.4 ml) was treated with 60% NaH (11.3 mg, 0.282 mmol, 5.0 eq) and the mixture was heated under reflux for 3 h. After cooling, the reaction mixture was poured into aqueous saturated NH_4Cl and the whole was extracted with EtOAc. Work-up of the EtOAc extract as de-

scribed above gave a product (26 mg), which was purified by column chromatography (SiO_2 5 g, *n*-hexane:EtOAc=20:1) to afford **FL₁** (**5**, 6.0 mg, 2.56×10^{-2} mmol, 46%) and **FL₂** (**6**, 4.8 mg, 1.03×10^{-2} mmol, 36%).

III) 1.0×10^{-2} mol/l in Benene: A solution of **4** (15 mg, 5.64×10^{-2} mmol) in dry benzene (5.64 ml) was treated with 60% NaH (11.3 mg, 0.282 mmol, 5 eq) and the mixture was heated under reflux for 2 h. After cooling, the reaction mixture was poured into aqueous saturated NH_4Cl and the whole was extracted with EtOAc. Work-up of the extract as described above gave a product (24 mg), which was purified by column chromatography (SiO_2 5 g, *n*-hexane:EtOAc=20:1) to afford **FL₁** (**5**, 1.8 mg, 7.69×10^{-3} mmol, 14%) and **FL₂** (**6**, 8.0 mg, 1.71×10^{-2} mmol, 61%).

IV) 1.0×10^{-3} mol/l in Benzene: A solution of **4** (15 mg, 5.64×10^{-2} mmol) in dry benzene (56.4 ml) was treated with 60% NaH (11.3 mg, 0.282 mmol, 5.0 eq) and the mixture was heated under reflux for 3 h. Work-up of the reaction mixture as described above gave a product (24 mg), which was purified by column chromatography (SiO_2 5 g, *n*-hexane:EtOAc=20:1) to furnish **FL₁** (**5**, 7.2 mg, 3.08×10^{-2} mmol, 55%) and **FL₂** (**6**, 4.3 mg, 9.19×10^{-3} mmol, 33%).

V) 1.0×10^{-2} mol/l in Toluene: A solution of **4** (15 mg, 5.64×10^{-2} mmol) in dry toluene (5.64 ml) was treated with 60% NaH (11.3 mg, 0.282 mmol, 5.0 eq) and the mixture was heated under reflux for 2 h. Work-up of the reaction mixture as above gave a product (27 mg), which was purified by column chromatography (SiO_2 5 g, *n*-hexane:EtOAc=20:1) to furnish **FL₁** (**5**, 6.2 mg, 2.70×10^{-2} mmol, 48%) and **FL₂** (**6**, 5.4 mg, 1.15×10^{-2} mmol, 41%).

VI) 1.0×10^{-3} mol/l in Toluene: A solution of **4** (15 mg, 5.64×10^{-2} mmol) in dry toluene (56.4 ml) was treated with 60% NaH (11.3 mg, 0.282 mmol, 5.0 eq) and the mixture was heated under reflux for 3 h. Work-up of the reaction mixture as above gave a product (26 mg), which was purified by column chromatography (SiO_2 5 g, *n*-hexane:EtOAc=20:1) to afford **FL₁** (**5**, 9.5 mg, 4.06×10^{-2} mmol, 72%) and **FL₂** (**6**, 3.2 mg, 0.68×10^{-2} mmol, 24%).

FL₁ (5): Colorless fine crystals (from petroleum ether), mp 49 °C. IR (KBr): 1689, 1651 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): end absorption, 205 (sh), 218 (sh), 237 (sh). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.58, 1.64, 1.82 (3H each, all brs, vinyl methyl $\times$ 3), 4.70 (2H, d, $J=8$ Hz, $-\text{CH}_2\text{OCO}-$), 4.6—5.0 (1H, m, olefinic proton), 5.48 (1H, t, $J=8$ Hz, olefinic proton), 6.51 (1H, t, $J=6$ Hz, olefinic proton). MS m/z (%): 234 (M^+ , 4.7), 82 (100). High-resolution MS m/z : Calcd for $\text{C}_{15}\text{H}_{22}\text{O}_2$: 234.162. Found: 234.162 (M^+).

FL₂ (6): Colorless fine crystals (from petroleum ether), mp 45 °C. IR (KBr): 1704, 1646 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): end absorption, 208 (sh), 218 (sh), 239 (sh). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.59, 1.71, 1.80 (6H each, all brs, vinyl methyl $\times$ 6), 4.63 (4H, d, $J=7$ Hz, $-\text{CH}_2\text{OCO}-$), 4.9—5.2 (2H, m, olefinic protons), 5.33 (2H, t, $J=7$ Hz, olefinic protons), 6.69 (2H, t, $J=6$ Hz, olefinic protons). MS m/z (%): 468 (M^+ , 5.8), 82 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_4$: 468.324. Found: 468.324 (M^+).

Epoxidation of FL₁ (5) A solution of **5** (80 mg, 0.34 mmol) and 70% MCPBA (253 mg, 1.02 mmol, 3.0 eq) in CHCl_3 (20 ml) was stirred at room temperature for 2.5 h. The reaction mixture was poured into aqueous saturated Na_2SO_3 and the whole was extracted with EtOAc. The EtOAc

extract was washed with aqueous saturated NaHCO_3 and aqueous saturated NaCl , then dried over MgSO_4 . Removal of the solvent under reduced pressure gave a product (200 mg), which was purified by column chromatography (SiO_2 , 20 g, n -hexane:EtOAc=4:1) to furnish FL_2E_2 (7, 76 mg, 0.29 mmol, 84%).

FL_2E_2 (7): A white powder. IR (film): 1708, 1644 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 216 (10500). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.20, 1.28 (3H each, both s, methyl $\times 2$), 1.83 (3H, brs, vinyl methyl), 2.60 (1H, t, $J=4$ Hz), 3.01 (1H, dd, $J=4$, 8 Hz), 3.9—4.8 (2H, m), 6.6—6.9 (1H, m, olefinic proton). MS m/z (%): 266 (M^+ , 0.1), 111 (100). High-resolution MS m/z : Calcd for $\text{C}_{15}\text{H}_{22}\text{O}_4$: 266.152. Found: 266.150 (M^+).

Epoxidation of FL_2 (6) A solution of **6** (200 mg, 0.43 mmol) and 70% MCPBA (461 mg, 2.14 mmol, 5.0 eq) in CHCl_3 (30 ml) was stirred at room temperature for 4 h. The reaction mixture was poured into aqueous saturated Na_2SO_3 and the whole was extracted with EtOAc. The EtOAc extract was washed with aqueous saturated NaHCO_3 and aqueous saturated NaCl , then dried over MgSO_4 . Removal of the solvent under reduced pressure gave a product (264 mg), which was purified by column chromatography (SiO_2 , 30 g, n -hexane:EtOAc=4:1) to furnish FL_2E_4 (8, 170 mg, 0.32 mmol, 75%).

FL_2E_4 (8): A white powder. IR (film): 1706, 1642 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 218 (21000). $^1\text{H-NMR}$ (90 MHz, CDCl_3) δ : 1.23, 1.31 (6H each, both s, methyl $\times 4$), 1.82 (6H, brs, vinyl methyl $\times 2$), 2.5—2.8 (2H, m), 2.9—3.1 (2H, m), 3.8—4.5 (4H, m), 6.73 (2H, m, olefinic protons). MS m/z (%): 532 (M^+ , 3.0), 111 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.304. Found: 532.304 (M^+).

HPLC Separation of FL_2E_4 (8) Giving Six Diastereomers (8a—8f) FL_2E_4 (8, 232 mg) was subjected to HPLC separation (Merck Hibar LiChrosorb Si60, n -hexane:EtOAc=3:1) to provide FL_2E_4 -1 (**8a**, 11 mg), FL_2E_4 -2 (**8b**, 53 mg), FL_2E_4 -3 (**8c**, 63 mg), FL_2E_4 -4 (**8d**, 42 mg), FL_2E_4 -5 (**8e**, 32 mg), and FL_2E_4 -6 (**8f**, 31 mg).

FL_2E_4 -1 (**8a**): Colorless needles, mp 114—115 °C (n -hexane—EtOAc). IR (CHCl_3): 1708, 1644 cm^{-1} . UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 217 (23000). $^1\text{H-NMR}$ (500 MHz, CDCl_3) δ : 1.36, 1.27 (6H each, both s, 6- CH_3 , 10- CH_3 , 6'- CH_3 , 10'- CH_3), 1.86 (6H, brs, 2- CH_3 , 2'- CH_3), 2.71 (2H, br t, 11-H, 11'-H), 3.03 (2H, t, $J=6.8$ Hz, 7-H, 7'-H), 4.17 (2H, dd, $J=6.2$, 12.2 Hz, 12-H_a, 12'-H_a), 4.34 (2H, dd, $J=4.8$, 12.2 Hz, 12-H_b, 12'-H_b), 6.77 (2H, t-like, 3-H, 3'-H). $^1\text{H-NMR}$ (500 MHz, CDCl_3 saturated with D_2O) δ : 1.25 (12H, brs, $\text{CH}_3 \times 4$), 1.83 (6H, brs, $\text{CH}_3 \times 2$), 2.72 (2H, t, $J=5.6$ Hz, 11-H, 11'-H), 3.04 (2H, t, $J=5.9$ Hz, 7-H_a, 7'-H_a), 4.16 (2H, dd, $J=6.3$, 12.2 Hz, 12-H_a, 12'-H_a), 4.35 (2H, dd, $J=4.6$, 11.8 Hz, 12-H_b, 12'-H_b), 6.78 (2H, t-like, 3-H, 3'-H). $^1\text{H-NMR}$ (500 MHz, CDCl_3 saturated with a saturated solution of K_2PtCl_4 in D_2O) δ : 1.25 (6H, brs, $\text{CH}_3 \times 2$), 1.60 (6H, brs, $\text{CH}_3 \times 2$), 1.83 (6H, brs, $\text{CH}_3 \times 2$), 2.72 (2H, t, $J=5.6$ Hz, 11-H, 11'-H), 3.03 (2H, t, $J=5.9$ Hz, 7-H_a, 7'-H_a), 4.16 (2H, dd, $J=6.3$, 12.2 Hz, 12-H_a, 12'-H_a), 4.35 (2H, dd, $J=4.6$, 11.8 Hz, 12-H_b, 12'-H_b), 6.78 (2H, t-like, 3-H, 3'-H). MS m/z (%): 532 (M^+ , 1.6), 95 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.303. Found: 532.302 (M^+).

FL_2E_4 -2 (**8b**): Colorless needles, mp 111—112 °C (n -hexane—EtOAc). IR (CHCl_3) cm^{-1} : 1710, 1645. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 216 (18000). $^1\text{H-NMR}$ (500 MHz, CDCl_3) δ : 1.26, 1.27, 1.35, 1.37 (3H each, all s, $\text{CH}_3 \times 4$), 1.86 (6H, brs, $\text{CH}_3 \times 2$), 2.63 (1H, t, $J=6.1$ Hz, 7-H or 7'-H), 3.23 (1H, br t, 11-H or 11'-H), 3.71 (1H, t, $J=6.1$ Hz, 7-H or 7'-H), 3.96 (1H, br t, 11-H or 11'-H), 4.03 (1H, dd, $J=6.4$, 12.2 Hz), 4.08 (1H, dd, $J=6.4$, 12.2 Hz), 4.29 (1H, dd, $J=4.9$, 12.2 Hz), 4.31 (1H, dd, $J=4.9$, 12.2 Hz), (12-H₂, 12'-H₂), 6.69 (2H, t, $J=6.5$ Hz, 3-H, 3'-H). MS m/z (%): 532 (M^+ , 2.0), 95 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.303. Found: 532.303 (M^+).

FL_2E_4 -3 (**8c**): Colorless needles, mp 112—113 °C (n -hexane—EtOAc). IR (CHCl_3) cm^{-1} : 1709, 1644. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 216 (13000). $^1\text{H-NMR}$ (500 MHz, CDCl_3) δ : 1.19, 1.21, 1.26, 1.28 (3H each, all s, $\text{CH}_3 \times 4$), 1.79 (6H, brs, $\text{CH}_3 \times 2$), 2.64 (1H, t, $J=5.8$ Hz, 7-H or 7'-H), 2.99 (2H, dd, $J=3.7$, 7.3 Hz, 11-H, 11'-H), 3.65 (1H, t, $J=6.4$ Hz, 7-H or 7'-H), 3.97 (1H, dd, $J=7.3$, 15.9 Hz), 4.01 (1H, dd, $J=7.3$, 15.9 Hz), 4.36 (2H, m) (12-H₂, 12'-H₂), 6.69 (2H, t-like, 3-H, 3'-H). MS m/z (%): 532 (M^+ , 2.2), 95 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.303. Found: 532.302 (M^+).

FL_2E_4 -4 (**8d**): Colorless needles, mp 112—113 °C (n -hexane—EtOAc). IR (CHCl_3) cm^{-1} : 1708, 1646. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 216 (23000). $^1\text{H-NMR}$

(500 MHz, CDCl_3) δ : 1.21, 1.25 (6H each, both s, $\text{CH}_3 \times 4$), 1.80 (6H, brs, $\text{CH}_3 \times 2$), 2.68 (2H, br t, 11-H, 11'-H), 3.02 (2H, dd, $J=3.1$, 7.9 Hz, 7-H, 7'-H), 4.16 (2H, dd, $J=6.6$, 12.0 Hz), 4.25 (2H, $J=4.6$, 12.0 Hz) (12-H₂, 12'-H₂), 6.62 (2H, t-like, 3-H, 3'-H). MS m/z (%): 532 (M^+ , 2.0), 95 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.303. Found: 532.302 (M^+).

FL_2E_4 -5 (**8e**): Colorless needles, mp 113—114 °C (n -hexane—EtOAc). IR (CHCl_3) cm^{-1} : 1705, 1643. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 215 (15000). $^1\text{H-NMR}$ (500 MHz, CDCl_3) δ : 1.28, 1.38 (6H each, both s, $\text{CH}_3 \times 4$), 1.86 (6H, brs, $\text{CH}_3 \times 2$), 2.77 (2H, t, $J=6.1$ Hz, 7-H, 7'-H), 3.09 (2H, dd, $J=4.6$, 6.4 Hz, 11-H, 11'-H), 4.12 (2H, dd, $J=6.4$, 12.2 Hz), 4.21 (2H, dd, $J=4.6$, 12.2 Hz), (12-H₂, 12'-H₂), 6.77 (2H, t, $J=7.6$ Hz, 3-H, 3'-H). MS m/z (%): 532 (M^+ , 2.2), 95 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.303. Found: 532.302 (M^+).

FL_2E_4 -6 (**8f**): Colorless needles, mp 112—113 °C (n -hexane—EtOAc). IR (CHCl_3) cm^{-1} : 1711, 1645. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (ϵ): 216 (21000). $^1\text{H-NMR}$ (500 MHz, CDCl_3) δ : 1.19, 1.28 (6H each, both s, $\text{CH}_3 \times 4$), 1.79 (6H, brs, $\text{CH}_3 \times 2$), 2.64 (1H, t, $J=5.9$ Hz, 7-H or 7'-H), 2.70 (1H, t, $J=6.2$ Hz, 7-H or 7'-H), 2.96 (1H, br t), 2.98 (1H, br t), (11-H, 11'-H), 4.03 (1H, dd, $J=6.1$, 12.1 Hz), 4.10 (1H, dd, $J=6.1$, 12.1 Hz), 4.28 (1H, dd, $J=4.9$, 12.1 Hz), 4.35 (1H, dd, $J=4.9$, 12.1 Hz), (12-H₂, 12'-H₂), 6.6—6.8 (2H, m, 3-H, 3'-H). MS m/z (%): 532 (M^+ , 2.2), 95 (100). High-resolution MS m/z : Calcd for $\text{C}_{30}\text{H}_{44}\text{O}_8$: 532.303. Found: 532.302 (M^+).

Ion-Transport and Ion-Permeation Activity Tests Ion-transport tests using a W-07 apparatus were carried out by the procedure described in the literature,⁴⁾ and ion-permeation activity employing human erythrocyte membrane was assayed by the procedure described in the literature.⁶⁾
