Studies on Nepalese Crude Drugs. XXIII.¹⁾ On the Diterpenoid Constituents of the Aerial Parts of *Scutellaria grossa* WALL.

Akiko OHNO, Haruhisa KIZU, and Tsuyoshi TOMIMORI*

Faculty of Pharmaceutical Sciences, Hokuriku University, Ho-3, Kanagawa-machi, Kanazawa 920-11, Japan.

Received January 22, 1997; accepted March 8, 1997

From the aerial parts of *Scutellaria grossa*, a new neoclerodane diterpene named scutegrossin A has been isolated together with five known neoclerodane diterpenes, jodrellin B, scutecolumnin A, scutalsin, scutecypol B and scutalbin B.

The structure of a new compound has been determined by spectroscopic and chemical methods as (11*S*,13*S*,16*S*,19*R*)-6*α*-*O*-acetyl-19-*O*-[(*E*)-2-methyl-2-butenoyl]-2*α*,19;4*α*,18;11,16;15,16-tetraepoxy-14-neoclerodene-6,19-diol.

In addition, the absolute stereochemistry of 2-methylbutanoyl group of scutecolumnin A and scutalbin B has been ascertained to be the *S* form.

Key words *Scutellaria grossa*; neoclerodane diterpene; scutegrossin A; Lamiaceae

In a previous paper,²⁾ we reported the structural identification of twelve flavonoids and three iridoids isolated from the leaves of *Scutellaria grossa*. In the course of our studies on Nepalese crude drugs¹⁾ and on the constituents of *Scutellaria* species,³⁾ we have subsequently investigated the dried aerial parts of *Scutellaria grossa*. This paper deals with the isolation and structural elucidation of the neoclerodane-type diterpenoids from this plant.

Repeated chromatography of the acetone extract of the material gave a new compound named scutegrossin A together with five known compounds, as described in the experimental section.

Compound **1** was identified as jodrellin B based on the spectral and physical data.⁴⁾

Scutegrossin A (**2**) was obtained as a white powder and was presumed to be a compound related to **1** from its spectral features. Its molecular formula was determined as C₂₇H₃₆O₈ based on high resolution (HR) electron impact (EI) MS and ¹³C-NMR spectral data. ¹H- and ¹³C-NMR spectra for **2** showed quite similar signal patterns to those for **1** except for the presence of the signals due to a tigloyl group instead of a 2-methylpropanoyl group in **1** (Tables 1, 2). The tigloyl group was suggested to be connected to the oxygen at C-19 position because the H-19 signal of **2** was observed at 0.13 ppm lower field than that of **1**, whereas the H-6 signal remained almost unchanged. This was confirmed based on the ¹H detected heteronuclear multiple bond connectivity (HMBC) spectral data: a ¹H-¹³C long-range correlation was observed between the H-19 (δ 7.22) and C-1' (δ 166.3) as well as between the H-6 (δ 4.93) and a carbonyl carbon in an acetyl group (δ 169.6). All the ¹H and ¹³C signals were firmly assigned based on the ¹H-¹H shift correlation (COSY), ¹H-¹³C COSY and HMBC spectral data.

The relative stereochemistry at the C-19 position was determined as the *R** configuration based on the difference nuclear Overhauser effect (NOE) spectral data: irradiation at the H-19 strongly enhanced the signal intensity of the H₃-20.

The absolute stereochemistry of **2** was confirmed by the

fact that **2**, on partial hydrolysis with 23% AcOH in tetrahydrofuran (THF)-H₂O, gave 19-*O*-deacetyl jodrellin A (**7**), whose absolute stereochemistry was reported earlier.⁵⁾

Consequently, the structure of scutegrossin A (**2**) was concluded to be (11*S*,13*S*,16*S*,19*R*)-6*α*-*O*-acetyl-19-*O*-[(*E*)-2-methyl-2-butenoyl]-2*α*,19;4*α*,18;11,16;15,16-tetraepoxy-14-neoclerodene-6,19-diol.

Compound **3** was suggested to be identical with scutecolumnin A⁶⁾ from its spectral features. However, the absolute stereochemistry of the 2-methylbutanoyl group as well as the clerodane skeleton of scutecolumnin A has not been elucidated.

Compound **3** was hydrolyzed with an alkali and then treated with (*R*)-(+)- α -phenylethylamine to give (2*S*)-*N*-

(1*R*-phenylethyl)-2-methylbutanamide, which was identified as a synthesized authentic specimen by means of capillary GLC. From this result the absolute configuration of 2-methylbutanoyl group proved to be the 2*S* form.

In order to confirm the structure including the absolute stereochemistry, 2*S*- and a mixture of 2*S*- and 2*R*-methylbutanoyl derivatives of **7** were synthesized. Compound **3** agreed with 2*S*-methylbutanoyl derivative. In addition, it was found that **3** and its 2'-epimer (**3a**) were clearly distinguishable from each other by comparisons of ¹H- and ¹³C-NMR spectra.

On the basis of these findings, the structure of **3** was concluded to be (11*S*,13*S*,16*S*,19*R*)-6*α*-*O*-acetyl-19-*O*-(2*S*-methylbutanoyl)-2*α*,19;4*α*,18;11,16;15,16-tetraepoxy-14-neoclerodene-6,19-diol.

Compound **4** was deduced to be identical with scutalsin isolated from *Scutellaria altissima*⁷⁾ from comparisons of its NMR spectral data with those of **1** and 14-hydro-15-hydroxyjodrellin A (**8**).⁵⁾

Compound **5** was deduced to be (11*S**,13*S**,16*S**,19*R**)-6*α*-*O*-acetyl-19-*O*-(*E*)-2-methyl-2-butenoyl]-2*α*,19;4*α*,18;11,16;15,16-tetraepoxyneoclerodane-6,15,19-triol from comparisons of its NMR spectral data with those of **2** and **4**. That is, **5** should be identical with scutecyprol B, however, none of the spectral or physical data are given in the literature.⁸⁾ Thus, **5** was subjected to oxidation with chromium trioxide to yield the lactone derivative (**9**), which was identified as the 15-oxo derivative of scutecyprol B.⁸⁾

Consequently, **5** is identical with scutecyprol B.

Compound **6** was easily assigned as (11*S**,13*S**,16*S**,

19*R**)-6*α*-*O*-acetyl-19-*O*-(2*S**-methylbutanoyl)-2*α*,19;4*α*,18;11,16;15,16-tetraepoxyneoclerodane-6,15,19-triol by comparisons of its spectral data (MS, IR, UV, NMR) with those of **3**, **3a** and **5**. Although the absolute configuration of **6** has not been confirmed, it is probably the same as **3** from a biogenetic point of view.

Compound **6** is presumably identical with scutalbin B isolated from *Scutellaria albida*.⁷⁾ However, the absolute stereochemistry of its 2-methylbutanoyl group has not been elucidated.

As described above, the diterpenoid constituents from the aerial parts of *Scutellaria grossa* were examined and a new neoclerodane diterpene, scutegrossin A (**2**) was isolated and characterized. Five known ones [**1** (jodrellin B), **3** (scutecolumnin A), **4** (scutalsin), **5** (scutecyprol B), **6** (scutalbin B)] were also isolated and the absolute configuration of the 2-methylbutanoyl part of **3** and **6** has been determined. Although compound **5** has proved to be identical with scutecyprol B, its isolation and characterization are the first example because it was separated as the 15-oxo derivative.⁸⁾

Experimental

General Procedures Unless otherwise stated, the following instruments and conditions were used. Optical rotation was recorded in EtOH on a JASCO DIP-370 digital polarimeter. IR spectra were recorded in KBr disks on a Hitachi 270-30 IR spectrophotometer and the data are given in cm⁻¹. UV spectra were recorded in EtOH on a Shimadzu UV-3000 recording spectrophotometer and peaks are given in λ_{max} nm (log ε). NMR spectra were recorded in pyridine-*d*₅ on a JEOL GSX-400 spectrometer (¹H-NMR at 400 MHz, ¹³C-NMR at 100 MHz) using a

a) Coupling constants (*J*) in Hz are given in parentheses. b) Data are taken from a ¹H-NMR spectrum of a mixture of **3** and **3a**. Chemical shifts of H₂-1—H₃-17 and H₂-18 are almost the same as **3**. c) Overlapped.

residual signal (β -CH) of the solvent as an internal standard (δ_C 123.5, δ_H 7.20), and chemical shifts are given in δ (ppm). When CDCl₃ was employed, tetramethylsilane was used as an internal standard. EI-MS and FAB-MS (positive ion mode; matrix, magic bullet) spectra were recorded on a JEOL JMS-SX-102A mass spectrometer and major peaks are indicated as *m/z* (%). For TLC, pre-coated silica gel 60F₂₅₄ plates (Merck) were used and spots were detected by spraying with dil. H₂SO₄ followed by heating. HPLC was performed on a Shimadzu LC-10AS pump system with a refractive index detector, Model RI-2 (Japan Analytical Industrial Co., Ltd.). GLC was performed on a Shimadzu GC-6AM instrument with a flame ionization detector, using a fused silica WCOT column with Carbowax 20M (Shinwa Kako Co., 0.2 mm i.d. $\times$ 25 m); column temperature, 178 °C; injection temperature, 250 °C; carrier gas, He; inlet press, 1.0 kg/cm²; make-up gas flow rate, 60 ml/min.

Isolation The plant material of *Scutellaria grossa* was collected at Kalopani, Dhaulagiri Zone in Nepal, in September, 1986, and a voucher specimen is deposited at the Herbarium of the Faculty of Pharmaceutical Sciences, Hokuriku University, Kanazawa, Japan. The dried aerial parts (1 kg) were extracted with boiling acetone (5 l $\times$ 3). The acetone extract was concentrated under reduced pressure. The residue (93 g) was chromatographed on silica gel (sol., benzene:AcOEt=1:0 $\rightarrow$ 0:1) to give six fractions (fr. 1—6, in the order of elution). Fraction 2 (4.1 g) was treated with hexane–acetone (8:1) and precipitates deposited were filtered off. The hexane–acetone soluble part was chromatographed on silica gel (sol., hexane:acetone=8:1) to give a diterpenoid mixture. The mixture was subjected to HPLC separation [column, YMC packed column D-SIL-5 S-5 120 Å SIL (20 mm i.d. $\times$ 250 mm); sol., benzene:AcOEt=10:1] to give **1** (54 mg) and a mixture of **2** and **3** (120 mg). The mixture of **2** and **3** was separated with HPLC (column, the same as above; sol., hexane:acetone=8:1) to give **2** (70 mg) and **3** (9 mg). Fraction 5 (2.4 g) was chromatographed on silica gel (sol., benzene:AcOEt=10:1 $\rightarrow$ 0:1) and then purified with medium pressure liquid chromatography (sol., benzene:acetone=4:1) to give a diterpenoid mixture. It was separated with HPLC [column, YMC packed column D-ODS-5 S-5 120 Å ODS (20 mm i.d. $\times$ 250 mm); sol., 65% MeOH] to give **4** (133 mg), **5** (97 mg) and **6** (37 mg).

Compound 1 White powder (from hexane–ether), $[\alpha]_D^{31}$ –12.4° (*c*=0.791), $[\alpha]_D^{31}$ –17.7° (*c*=0.807, CHCl₃). ¹³C-NMR: Table 1.

¹H-NMR: Table 2. Spectral and physical data are compatible with jodrellin B.⁴⁾

Scutegrossin A (2) [(11*S*,13*S*,16*S*,19*R*)-6 α -O-Acetyl-19-O-[(*E*)-2-methyl-2-butenoyl]-2 α ,19; 4 α ,18; 11,16; 15,16-tetraepoxy-14-neoclerodene-6,19-diol] White powder (from hexane–acetone). $[\alpha]_D^{32}$ +8.8° (*c*=0.228). IR: 2984, 1738, 1704, 1652, 1620, 1372, 1274, 1236, 1194, 1142, 1012. UV: 222 (3.80). ¹³C-NMR: Table 1. ¹H-NMR: Table 2. EI-MS: 488 (M⁺, 0.8), 428 (0.8), 405 [(M–C₅H₇O)⁺, 13], 389 [(M–C₅H₇O₂)⁺, 92], 218 (25), 111 (61), 83 (100). HR-EI-MS *m/z*: 488.2408 (M⁺) (Calcd for C₂₇H₃₆O₈: 488.2410).

Partial Hydrolysis of 2 To a solution of **2** (8 mg) in a mixture of THF (1.6 ml) and water (0.4 ml) was added AcOH (0.6 ml) and the solution was allowed to stand at room temperature for 1 d. The reaction mixture was diluted with CHCl₃ and then washed successively with 1 N NaOH and brine. The organic layer was dried over anhyd. Na₂SO₄. After removal of the solvent, the residue was chromatographed on silica gel (sol., benzene:AcOEt=3:1) to give **7** (3 mg) and unchanged **2** (3 mg). Compound **7** was identified as 19-O-deacetyl-jodrellin A by direct comparison with an authentic sample.⁵⁾

Compound 3 [(11*S*,13*S*,16*S*,19*R*)-6 α -O-Acetyl-19-O-(2*S*-methylbutanoyl)-2 α ,19; 4 α ,18; 11,16; 15,16-tetraepoxy-14-neoclerodene-6,19-diol] Colorless oil, $[\alpha]_D^{31}$ –12.8° (*c*=0.296), $[\alpha]_D^{30}$ –18.4° (*c*=0.287, CHCl₃). IR (CHCl₃ soln.): 2976, 2944, 1728, 1620, 1466, 1376, 1256, 1140, 1082, 1008. UV: 211 (3.52), 266 (1.92). ¹³C-NMR: Table 1. ¹H-NMR: Table 2. EI-MS: 490 (M⁺, 3), 405 [(M–C₅H₉O)⁺, 6], 389 [(M–C₅H₉O₂)⁺, 100], 218 (35), 172 (30), 111 (78). HR-EI-MS: 490.2565 (M⁺) (Calcd for C₂₇H₃₈O₈: 490.2567).

Synthesis of (2*S*)- and (2*R*)-N-(1*R*-Phenylethyl)-2-methylbutanamide To a solution of (*S*)-(+)-2-methylbutanoic acid (Aldrich®, 31 mg) in CH₂Cl₂ (1.5 ml) was added successively dicyclohexylcarbodiimide (74 mg), 4-dimethylaminopyridine (8 mg) and (*R*)-(+)- α -phenylethyl amine (Tokyo Kasei Kogyo Co., Ltd., 45 mg) at 0 °C and the reaction mixture was stirred at room temperature for 3 h. After filtration, the filtrate was diluted with CH₂Cl₂ and then washed successively with 1 N HCl, 1 N NaOH and brine. The organic layer was dried over anhyd. Na₂SO₄ and then concentrated. The residue was chromatographed on silica gel (sol., hexane:acetone=3:1) to give (2*S*)-N-(1*R*-phenylethyl)-2-methylbutanamide (43 mg). In the same

manner, (2*RS*)-*N*-(1*R*-phenylethyl)-2-methylbutanamide (85 mg) was prepared from (*RS*)-(+)-2-methylbutanoic acid (Aldrich®, 58 mg) and (*R*)-(+)- α -phenylethyl amine (59 mg).

(2*RS*)-*N*-(1*R*-Phenylethyl)-2-methylbutanamide: Colorless needles (from ether), mp 104–105°C. ¹H-NMR (CDCl₃): 0.92 (3H, t, *J* = 7.3 Hz), 1.12 (3H, d, *J* = 7.0 Hz), 1.50 (3H, d, *J* = 7.0 Hz), 1.44, 1.68 (each 1H, double quintet, *J* = 13.6, 7.3 Hz), 2.08 (1H, sextet, *J* = 7.0 Hz), 5.16 (1H, quintet, *J* = 7.0 Hz), 5.63 (1H, brs), 7.25–7.35 (5H, m). ¹³C-NMR (CDCl₃): 11.9, 17.5, 21.7, 27.4, 43.3, 48.4, 126.2 ($\times 2$), 127.3, 128.7 ($\times 2$), 143.3, 175.4. Retention time on GLC: 30.9 min.

(2*RS*)-*N*-(1*R*-Phenylethyl)-2-methylbutanamide: ¹H- and ¹³C-NMR (CDCl₃) signals due to the 2*S* form are the same as described above. ¹H-NMR (CDCl₃) signals due to the 2*R* form: 0.85 (3H, t, *J* = 7.3 Hz), 1.14 (3H, d, *J* = 7.0 Hz), 1.49 (3H, d, *J* = 7.0 Hz), 1.41, 1.65 (each 1H, double quintet, *J* = 13.6, 7.3 Hz), 2.09 (1H, sextet, *J* = 7.0 Hz), 5.15 (1H, quintet, *J* = 7.0 Hz), 7.25–7.35 (5H, m). ¹³C-NMR (CDCl₃) signals due to the 2*R* form: 11.9, 17.5, 21.6, 27.4, 43.3, 48.4, 126.2 ($\times 2$), 127.2, 128.6 ($\times 2$), 143.3, 175.5. Retention times on GLC: 30.1 min (2*R* form), 30.9 min (2*S* form).

Alkaline Hydrolysis of 3 Followed by Amidation with (*R*)-(+)- α -Phenylethylamine A solution of 3 (2 mg) in a mixture of 1*N* NaOH (0.6 ml) and THF (0.75 ml) was vigorously stirred at 60°C for 8 h. After cooling, the reaction mixture was diluted with H₂O and extracted with CHCl₃. Aqueous layer was acidified with 1*N* HCl and extracted with CHCl₃. The CHCl₃ layer was dried over anhyd. Na₂SO₄ and then concentrated to dryness to give a residue (0.3 mg). To a solution of the residue in CH₂Cl₂ (1 ml) were added dicyclohexylcarbodiimide (1.7 mg), 4-dimethylaminopyridine (0.6 mg) and (*R*)-(+)- α -phenylethyl amine (0.8 mg) at 0°C. The reaction mixture was allowed to stand at room temperature for 2 h, diluted with CH₂Cl₂ (10 ml) and poured into ice water. After being washed successively with 1*N* HCl, 1*N* NaOH and brine, the CH₂Cl₂ layer was dried over anhyd. Na₂SO₄ and concentrated. The residue was dissolved in MeOH and analyzed by GLC, which revealed the presence of (2*S*)-*N*-(1*R*-phenylethyl)-2-methylbutanamide (*t_R* 30.9 min).

Synthesis of 3 and 3a from 7 i) To a solution of 7 (21 mg) and (*S*)-(+)-2-methylbutanoic acid (6 mg) in benzene (12 ml) was added molecular sieve 5 Å (1 g) and the solution was refluxed for 1 h. After filtration, the residue was washed with CH₂Cl₂. The washings and filtrate were combined and washed successively with 1*N* NaOH and brine. The organic phase was dried over anhyd. Na₂SO₄ and concentrated to give a residue, which was chromatographed on silica gel (sol., benzene: AcOEt = 4:1 $\rightarrow$ 1:1) to give a product (5 mg) together with unchanged 7 (4 mg). ¹H- and ¹³C-NMR spectra and optical rotation of the product coincided with those of 3.

ii) In the same manner, 7 (20 mg) was treated with (*RS*)-(+)-2-methylbutanoic acid (6 mg) to give a mixture of 3 and 3a (4 mg). ¹H- and ¹³C-NMR signals due to 3a are described in Tables 2 and 1, respectively.

Compound 4 [(11*S,13*S**,16*S**,19*R**)-6*α*-O-Acetyl-19-O-(2-methylpropanoyl)-2*α*,19; 4*α*,18; 11,16; 15,16-tetraepoxyneoclerodane-6,15,19-triol]** White powder (from hexane-acetone), $[\alpha]_D^{25} + 8.3^\circ$ (*c* = 0.805), IR (CHCl₃ soln.): 3016, 2980, 1730, 1456, 1376, 1256, 1158, 1082, 1022. ¹H-NMR signals due to 15*R** form: 0.78 (3H, d, *J* = 6.6 Hz, H₃-17), 1.17 (3H, s, H₃-20), 1.27, 1.29 (each 3H, d, *J* = 7.0 Hz, H₃-3', H₃-4'), 2.05 (3H, s, Ac), 2.41, 3.14 (each 1H, d, *J* = 4.4 Hz, H₂-18), 4.10 (1H, dd, *J* = 4.8, 11.7 Hz, H-11), 4.15 (1H, m, H-2), *ca.* 4.9 (overlapped with water, H-6), 6.05 (1H, m, H-15), 6.13 (1H, d, *J* = 5.1 Hz, H-16), 7.11 (1H, s, H-19). ¹H-NMR signals due to 15*S** form: 0.82 (3H, d, *J* = 6.6 Hz, H₃-17), 1.15 (3H, s, H₃-20), 1.27, 1.29 (each 3H, d, *J* = 7.0 Hz, H₃-3', H₃-4'), 2.05 (3H, s, Ac), 2.36, 3.13 (each 1H, d, *J* = 4.4 Hz, H₂-18), 4.15 (1H, m, H-2), 4.85 (1H, dd, *J* = 5.9, 11.0 Hz, H-11), *ca.* 4.9 (overlapped with water, H-6), 5.82 (1H, d, *J* = 5.1 Hz, H-15), 6.01 (1H, d, *J* = 5.5 Hz, H-16), 7.11 (1H, s, H-19). ¹³C-NMR: Table 1. FAB-MS: 517 [(M + Na)⁺, 48], 407 [(M - C₄H₇O₂)⁺, 90], 219 (28), 173 (49), 119 (100), 111 (79), 85 (75). *Anal.* Calcd. for C₂₆H₃₈O₉: C, 63.13; H, 7.75. Found: C, 63.34; H, 8.02.

Ac), 1.98 m (3H, m, H₃-5'), 2.44, 3.17 (or 3.16) (each 1H, d, *J* = 4.8 Hz, H₂-18), 2.63 (1H, m, H-3 α), 3.12 (1H, m, H-13), 4.12 (1H, dd, *J* = 4.8, 11.4 Hz, H-11), 4.17 (1H, m, H-2), 4.94 (1H, dd, *J* = 4.8, 12.1 Hz, H-6), 5.82 (1H, brd, *J* = 5.5 Hz, H-15), 6.01 (1H, d, *J* = 5.5 Hz, H-16), 7.24 (1H, s, H-19), 7.35 (1H, m, H-3'), 8.22 (1H, brs, 15-OH). ¹H-NMR signals due to 15*S** form: 0.81 (3H, d, *J* = 6.6 Hz, H₃-17), 1.19 (3H, s, H₃-20), 1.66 (3H, m, H₃-4'), 1.92 (3H, s, Ac), 1.98 m (3H, H₃-5'), 2.78 (1H, m, H-13), 4.17 (1H, m, H-2), 4.86 (1H, dd, *J* = 5.9, 11.0 Hz, H-11), 4.94 (1H, dd, *J* = 4.8, 12.1 Hz, H-6), 6.06 (1H, brd, *J* = 3 Hz, H-15), 6.13 (1H, d, *J* = 5.5 Hz, H-16), 7.24 (1H, s, H-19), 7.35 (1H, m, H-3'), 8.26 (1H, brs, 15-OH). ¹³C-NMR: Table 1. FAB-MS: 529 [(M + Na)⁺, 30], 407 [(M - C₅H₇O)⁺, 48], 371 (22), 177 (30), 119 (100), 111 (43), 103 (46), 85 (72), 83 (92). *Anal.* Calcd. for C₂₇H₃₈O₉ · 1/2H₂O: C, 62.88; H, 7.63. Found: C, 62.81; H, 7.68.

Oxidation of 5 To a solution of 5 (30 mg) in pyridine (2 ml) was added chromium trioxide (100 mg) and the reaction mixture was allowed to stand at room temperature for 20 h. After being diluted with H₂O (10 ml), the reaction mixture was extracted with ether. The ether extract was washed with H₂O and concentrated to give a residue, which was chromatographed on silica gel (sol., benzene: AcOEt = 10:1 $\rightarrow$ 1:1) to give the lactone derivative (9, 17 mg). Compound 9: colorless needles (from ether-acetone), mp 237–239°C, $[\alpha]_D^{28} + 15.5^\circ$ (*c* = 0.177, CHCl₃). ¹³C-NMR: Table 1. The ¹H-NMR spectrum and optical rotation of 9 coincided with those of the 15-oxo derivative of scutecypol B.⁸⁾

Compound 6 [(11*S,13*S**,16*S**,19*R**)-6*α*-O-Acetyl-19-O-(2*S**-methylbutanoyl)-2*α*,19; 4*α*,18; 11,16; 15,16-tetraepoxyneoclerodane-6,15,19-triol]** White powder (from hexane-acetone), $[\alpha]_D^{26} + 3.1^\circ$ (*c* = 0.382), IR (CHCl₃ soln.): 3016, 2980, 1730, 1466, 1376, 1256, 1152, 1082, 1022. UV: 217 (1.61). ¹H-NMR signals due to 15*R** form: 0.78 (3H, d, *J* = 6.6 Hz, H₃-17), 0.96 (3H, t, *J* = 7.3 Hz, H₃-4'), 1.17 (3H, s, H₃-20), 1.29 (3H, d, *J* = 7.3 Hz, H₃-5'), 2.08 (3H, s, Ac), 2.41, 3.15 (each 1H, d, *J* = 4.4 Hz, H₂-18), 4.10 (1H, dd, *J* = 4.8, 11.4 Hz, H-11), 4.15 (1H, m, H-2), *ca.* 4.9 (overlapped with H₂O, H-6), 6.06 (1H, brs, H-15), 6.13 (1H, d, *J* = 5.5 Hz, H-16), 7.11 (1H, s, H-19). ¹H-NMR signals due to 15*S** form: 0.82 (3H, d, *J* = 6.2 Hz, H₃-17), 0.95 (3H, t, *J* = 7.3 Hz, H₃-4'), 1.15 (3H, s, H₃-20), 1.29 (3H, d, *J* = 7.3 Hz, H₃-5'), 2.07 (3H, s, Ac), 2.36, 3.14 (each 1H, d, *J* = 4.4 Hz, H₂-18), 4.15 (1H, m, H-2), 4.85 (1H, dd, *J* = 5.9, 11.0 Hz, H-11), *ca.* 4.9 (overlapped with H₂O, H-6), 5.82 (1H, brd, *J* = 5.1 Hz, H-15), 6.01 (1H, d, *J* = 5.5 Hz, H-16), 7.11 (1H, s, H-19). ¹³C-NMR: Table 1. FAB-MS: 531 [(M + Na)⁺, 30], 407 [(M - C₅H₉O₂)⁺, 44], 371 (26), 195 (28), 177 (34), 119 (100), 111 (31), 103 (41), 85 (64). HR-FAB-MS: 531.2571 [(M + Na)⁺] (Calcd for C₂₇H₄₀NaO₉: 531.2570).

Acknowledgements We are grateful to Dr. N. P. Manandhar, Royal Botanical Garden, Ministry of Forests, His Majesty's Government of Nepal, for his identification of *Scutellaria grossa* WALL., and to members of the analytical center of this university for elemental analyses and MS measurements.
