Key words: pleural cyst, serous adenocarcinoma, adnexa uteri, pleural metastasis

Figure 1. Left thoracoscopy showed a pleural cyst measuring 1.5cm in diameter (arrow) and adjacent daughter cysts (arrowheads) on the diaphragmatic pleura.

A 74-year-old woman consulted our hospital complaining of cough that had persisted for the previous 3 months. Chest computed tomographic (CT) scan showed bilateral pleural effusion without any pulmonary lesions. Pleural effusion cytology showed adenocarcinoma. Barium enema, gastroduodenoscopy and abdominal CT did not demonstrate any abnormal findings. Serum CEA, NSE and CYFRA21-1 were 26.8 (cutoff: 5) ng/ml, 43.7 (cutoff: 10) ng/ml and 67.5 (cutoff: 3.5) ng/ml, respectively. After removal of 1,500 ml of pleural effusion, left thoracoscopy showed a few eccentric pleural cysts on the diaphragmatic pleura (Fig. 1). No pleural nodule suggestive of malignancy was recognized. The content of the cyst was clearly serous fluid. Pathologic examination of the cyst showed a small focus of adenocarcinoma.
A: Microscopically, the pleural cyst was unilocular. A small focus of adenocarcinoma was recognized in the cyst wall (arrows). B: Most tumor cells had abundant clear or pale eosinophilic cytoplasm, oval nuclei and inconspicuous nucleoli. Stain: hematoxylin and eosin; magnification A: ×2.5, B: ×100.

Figure 2. A: Microscopically, the pleural cyst was unilocular. A small focus of adenocarcinoma was recognized in the cyst wall (arrows). B: Most tumor cells had abundant clear or pale eosinophilic cytoplasm, oval nuclei and inconspicuous nucleoli. Stain: hematoxylin and eosin; magnification A: ×2.5, B: ×100.

Immunohistochemical studies showed that these carcinoma cells were positive for AE1/AE3, EMA, CA125 and cytokeratin (CK)-7, but negative for CEA, TTF-1 and CK-20. The tentative diagnosis was Stage IV pulmonary adenocarcinoma. Systemic chemotherapy achieved stable disease. Six months later, the patient underwent surgery for right uterine adnexal tumor with diffuse peritoneal dissemination. Pathologic examination of the resected specimen demonstrated that the tumor was a poorly differentiated serous adenocarcinoma arising in the right adnexa uteri. Conclusively, we diagnosed pleural lesions as distant metastases of uterine adnexal serous adenocarcinoma. To our knowledge, the formation of these pleural cysts by metastatic carcinoma has not yet been reported in the literature. We propose two possible explanations for cyst formation by metastatic lesions: 1) localized edema in the submesothelial space due to carcinomatous obstruction of superficial vessels in the pleura caused pleural cysts; and 2) metastatic cancer cells in the pleura produced serous fluid in the submesothelial space and formed cystic lesions. The elucidation of its etiology, however, requires the accumulation of additional cases. Thoracic oncologists and pathologists should be aware of the varied gross manifestations of metastatic adenocarcinoma to the pleura and should bear in mind the differential diagnoses of pleural cysts.
