A 47-year-old man with polymyositis presented with obscure gastrointestinal bleeding. Capsule endoscopy revealed a pink-colored intraluminal mass in the middle ileum. (Picture 1, arrow). Retrograde double balloon endoscopy showed a tubular segment with an ulcer (10 cm long × 2.5 cm in diameter) protruding into the lumen of the bowel at approximately 80 cm proximal to the ileocaecal valve (Picture 2). Surgical resection revealed the presence of an inverted Meckel’s diverticulum (Picture 3). A preoperative diagnosis of Meckel’s diverticulum may be difficult (1). These are interesting images of an inverted Meckel’s diverticulum.

The authors state that they have no Conflict of Interest (COI).
