Ablation of Ventricular Tachycardia Associated with Dilated Cardiomyopathy and Sarcoidosis

Kyoko Soejima
Kawasaki Tama Municipal Hospital, St. Marianna University School of Medicine, Kawasaki, Japan

Catheter ablation of ventricular tachycardia associated with structural heart disease remains challenging. Compared to the ischemic cardiomyopathy, non-ischemic cardiomyopathy has variable location of the reentrant circuit and some require epicardial or surgical ablation. Pre-ablation imaging study can identify the location of the scar and help to guide the approach to the ablation. In this session, sarcoidosis and dilated cardiomyopathy VT will be discussed.

Keywords: ventricular tachycardia, sarcoidosis, dilated cardiomyopathy
