10. In most of the cases the occurrence of stabilization as properly nasal diseases is to be attributed to constitutional factors traceable to youth and childhood.

11. In view of the presence of these multiple factors influencing the nature and development of properly nasal diseases, their therapy should not be resorted to stereotyped treatment simply adopted following the diagnosis of the disease. Instead the classification type and individual character of each case should be noted on the constitution, age, overall observation of septum and other osseous structures as well as accessory cavities not only in the status but also in the trend of development. These are all necessary points in considering the advisability of operative treatments. As to the selection of operative technique, interrelationship of various parts of the nasal cavity should be also taken into consideration.

ON THE X-RAY PHOTOGRAPHY OF ETMOIDAL CELLS WITH SPECIAL REFERENCE OF THE TEGMEN

By

I. GONDA

*From the Oto-rhino-laryngological Department, Tokyo Jikeikai
Medical College.*

The author described his own technique, in which the central beam coincides with the "nasion-inion line." By this technique the *lamina cribiformis* and the inner wall of the attic of the ethmoidal cells is more clearly envisaged than by the procedure of Sonnenkalb. Consequently operative treatment is made easier by the X-ray photographs taken by the author's technique.
