Fourth Juntendo University–Hitachi Cooperative Research Workshop
Development of a Non‐Invasive Diagnostic Method for Esophageal Squamous Cell Carcinoma
by Gas Chromatographic Analysis of Patients’ Exhaled Breath

Background: Since esophageal carcinoma progresses asymptptomatically, for many patients, the disease is already advanced at the time of diagnosis. Compared with other digestive organs, esophageal carcinoma progresses rapidly and has a poor prognosis, making early diagnosis important. There is a need to develop a diagnostic method using clinical markers that is non-invasive while being both highly sensitive and specific.

Method: Exhaled breath was collected from 17 patients with esophageal squamous cell carcinoma, as well as 9 healthy subjects (control group) with no history of cancer. For each fasting subject, 1 L of exhaled breath was collected in a gas sampling bag. Volatile organic compounds (VOCs) were then extracted from each sample using Solid-Phase Micro-Extraction (SPME) fibers and analyzed by gas chromatography.

Results: Comparison of the principal component analyses of the VOCs showed a significant difference between the patient group and the healthy control group. In the patient group, significant increases were observed in 4 VOCs, namely, acetonitrile, acetic acid, acetone, and 2-butanone. Receiver operating characteristic (ROC) curves were drawn for acetonitrile, acetic acid, acetone, and 2-butanone. The calculated area-under-the-curve (AUC) indicated that esophageal carcinoma patients can be identified with a high probability of 0.93.

Conclusions: It was confirmed that there are significant differences in the contents of certain VOCs contained in the exhaled breath of esophageal carcinoma patients compared with that of healthy subjects. The analysis for these VOCs is inexpensive, simple and non-invasive, causing no adverse reactions, and it has potential as a new tool for detecting early-stage esophageal carcinoma.

Key words: breath analysis, esophageal carcinoma, gas chromatography, volatile organic compounds
