Integrating care through integrated teams. A multidisciplinary approach

Respiratory disorders are for the main part chronic diseases with patients often having many contacts with health care services, yet health care provision can be, or can appear to be, fragmented in terms of actual delivery. Increasingly worldwide trends in health care reforms and new organizational arrangements focus on more coordinated and integrated forms of care provision. Taking as a focus the integrated care literature which distinguishes between different ways and degrees of working together the presentation will focus on the three central terms in this respect which are autonomy, co-ordination and integration, looking at the more national picture and incentives and using local illustrations to demonstrate effective multidisciplinary working.
