11 cases of tumor in the posterior fossa, seen in recent years were reported. These cases consisted of 2 acoustic tumors, 2 meningiomas, 2 metastatic tumors and 1 each of astrocytoma, ependymoma, medulloblastoma, reticulosarcoma, and cyst. The diagnosis of these cases was made in each by operative findings or autopsies. From the neuro-otological point of view, each cases are discussed during pre- and postoperative course. For localizing the lesion, neuro-otological findings were exceedingly useful in all cases. This examination gave only objective finding for three of L1 cases. Authers emphasize that neuro-otological examination contributes to estimate the impairment of brain stem or postoperative condition upon the posterior fossa tumors.

36. Early Diagnosis and Operation Method of Acoustic Neurinoma

Taizo TSUKUMO, Ryo NAKANISHI, Shigeo TOYA and Yoshiyuki ISHIDA
