57. *A Newly Discovered Asteroid "Tokyo 5."*

By Okuro OIKAWA.

Tokyo Astronomical Observatory.

(Rec. April 4, 1927. Comm. by S. HIRAYAMA, M.I.A., April 12, 1927.)

A new object with large daily motion was photographed on Feb. 7 and the discovery was cabled to the Central Bureau of the International Astronomical Union on Feb. 12. Approximate positions of the early observations are as follows :

	U.T.	Plate	R.A.(1927.0)	Decl.(1927.0)	Mag.	Exposure
1927 Feb.	7.4928	421	7h 55m 3s	+18°16'.2	11m.5	60m
	8.4760	423	7 53 41	+17 58 .7		60

(measured by K. KINOSHITA)

The positions derived from further observations are as follows :

	U.T.	Plate	R.A.(1927.0)	Decl.(1927.0)	Log. Parall. Fac.	No. of Comparison Stars
1927 Feb.	9.622568	429	7h 52m 8s .87	+17°38'26".5	9.315 0.461	10
	10.564870	430	7 50 56 .16	+17 21 55 .1	8.624 0.438	9
	10.594729	432	7 50 53 .79	+17 21 23 .0	9.128 0.450	10

Each position is the mean of three exposures (10 minutes) on a plate. Comparison stars are taken from A. G. Berlin A and Abbadia Catalogue, corrected for the systematic errors in Boss' Preliminary General Catalogue.

I have got the last observation on March 7, the orbit is now under calculation.
